

Intelligence Cycle

INSTRUCTOR'S PROFILE

NAME

Military Schooling:

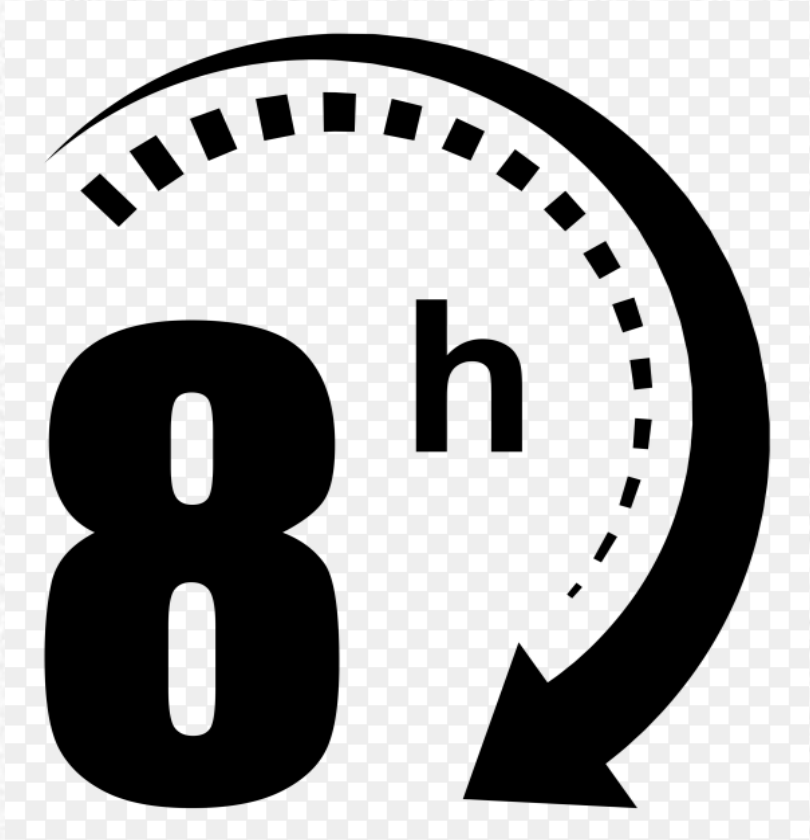

Previous Assignment:

Civilian Schooling:

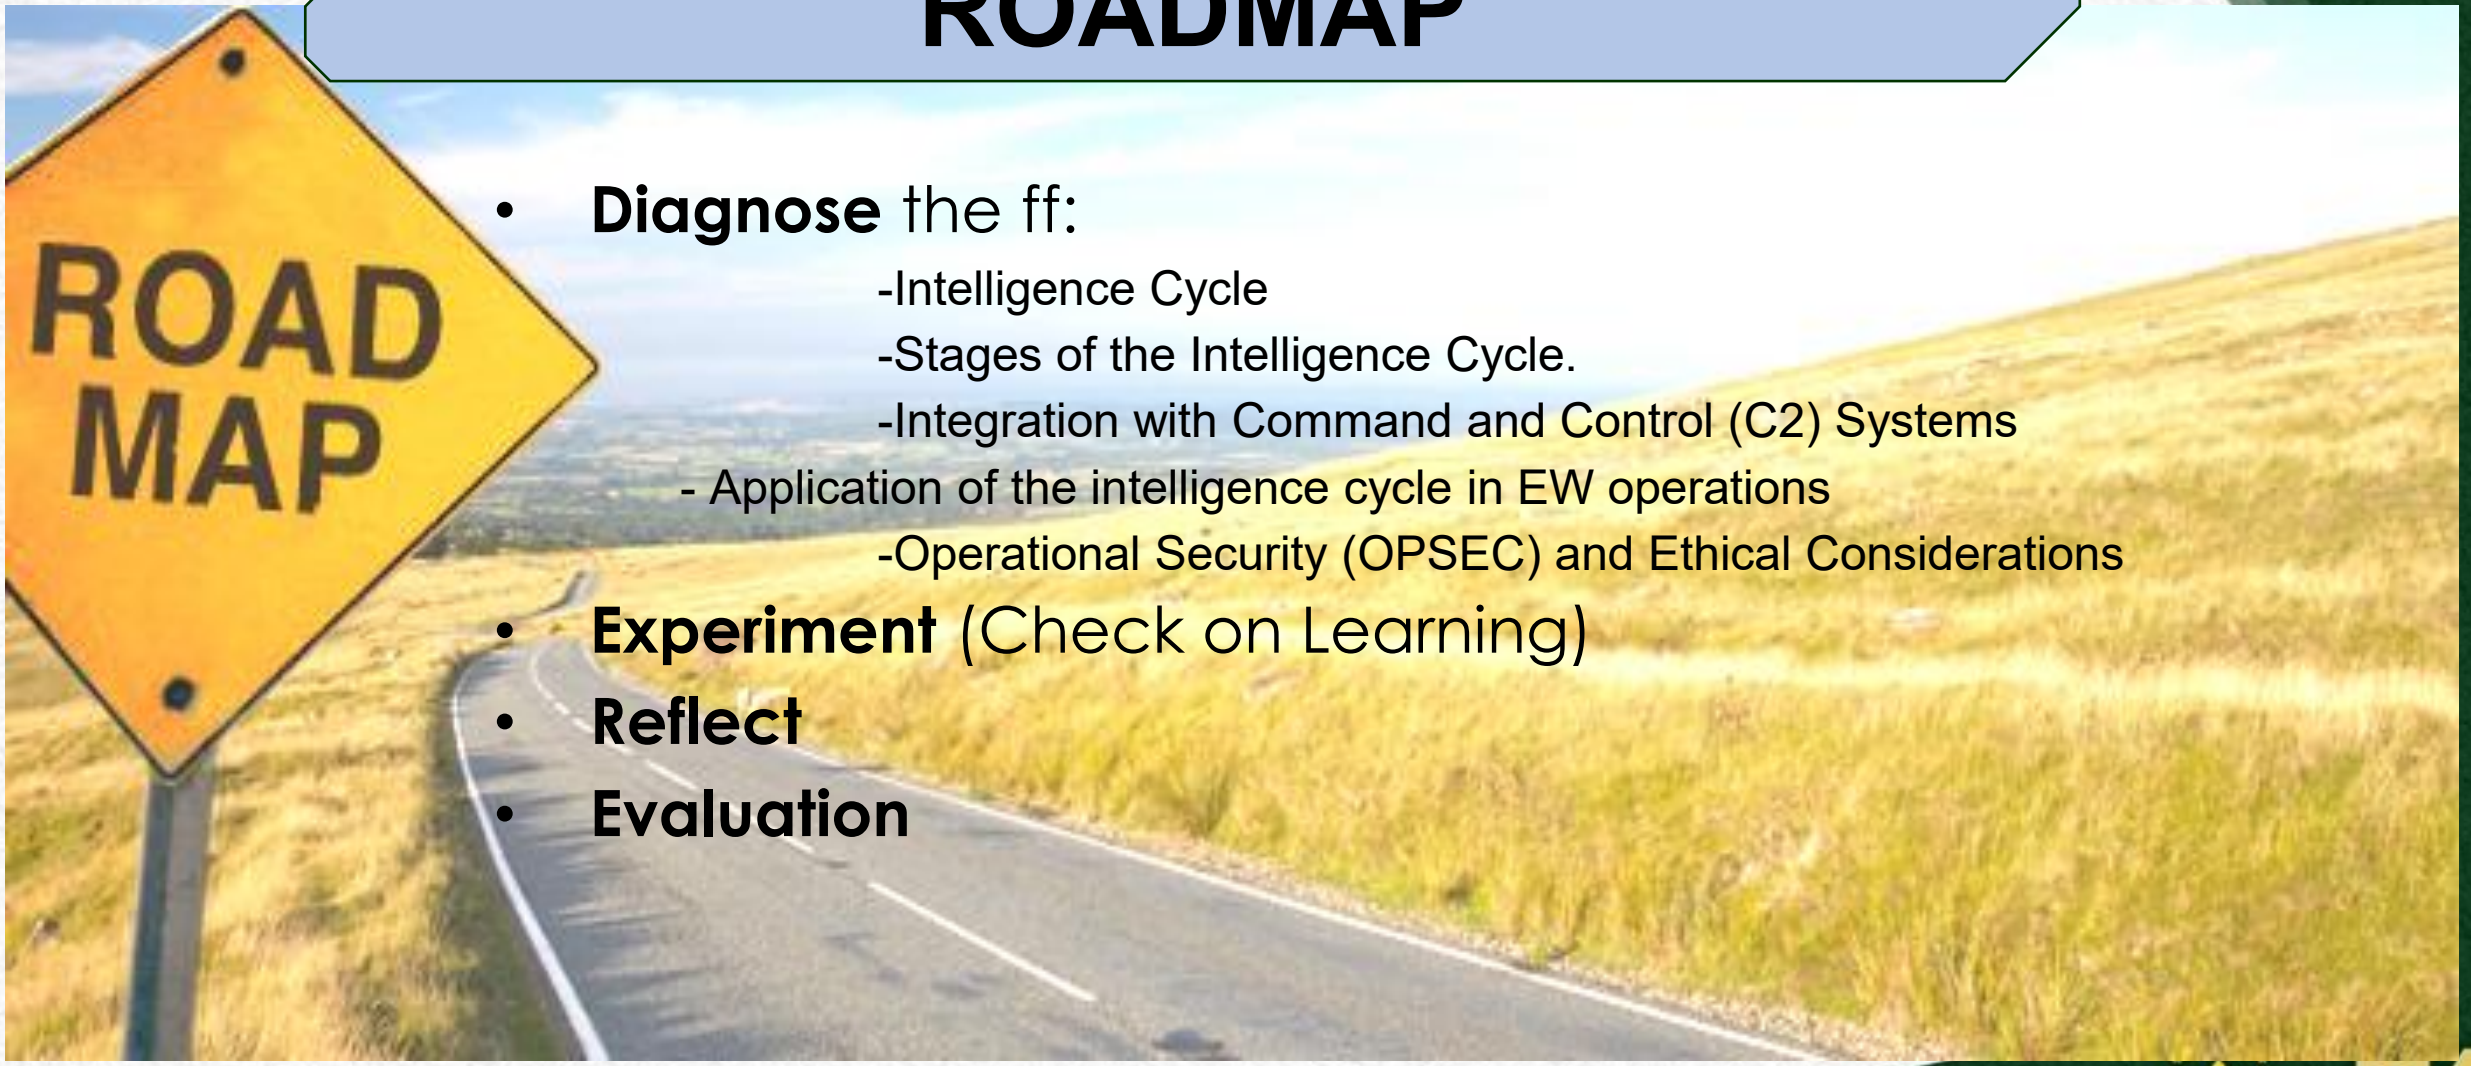

NEED

Understanding of intelligence, the intelligence cycle in relation to EW operations. To be able to conduct first line processing and analysis of EW collect in order to support the tactical commander.

TIME

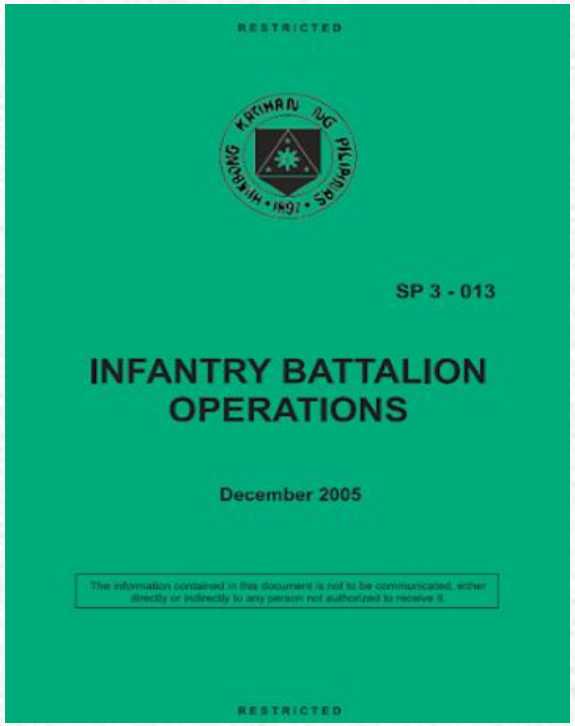

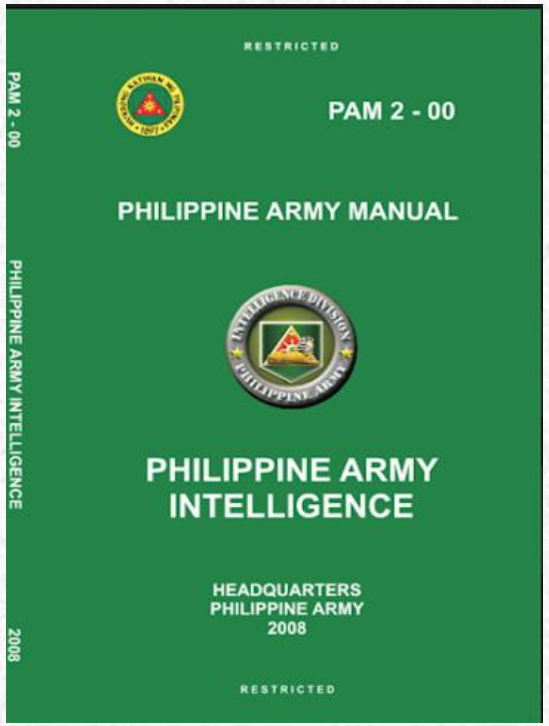

ROADMAP

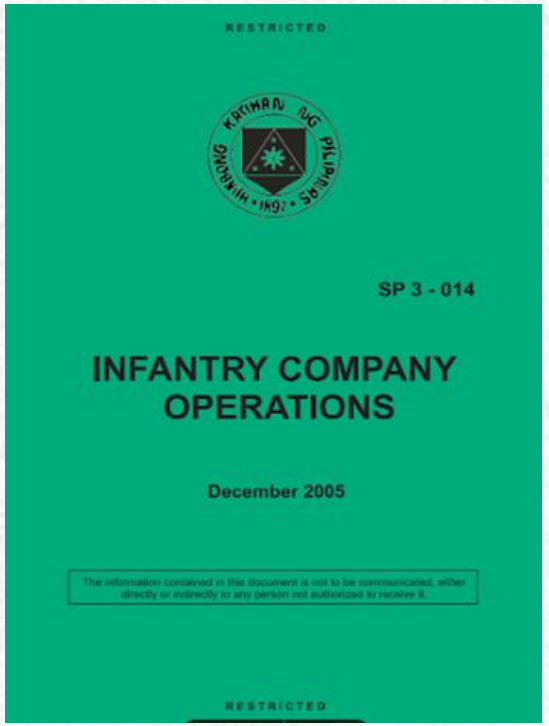

- **Diagnose** the ff:
  - -Intelligence Cycle
  - -Stages of the Intelligence Cycle.
  - -Integration with Command and Control (C2) Systems
  - - Application of the intelligence cycle in EW operations
  - -Operational Security (OPSEC) and Ethical Considerations
- **Experiment** (Check on Learning)
- **Reflect**
- **Evaluation**

The Intelligence Cycle

Introduction to Intelligence and the Intelligence Cycle

What is Intelligence?

Definition: Intelligence is the process of gathering, analyzing, and disseminating information to support decision-making in military operations.

- is the product of knowledge and understanding of the terrain, weather, activities, capabilities and intentions of an actual or potential threat or any forces with which the Army is concerned.

Significance in Military and EW Operations:

Military Operations: Provides commanders with actionable insights to understand threats, predict adversary actions, and optimize mission success.

EW Operations: Enhances situational awareness, supports the identification of electronic threats, and informs countermeasure strategies.

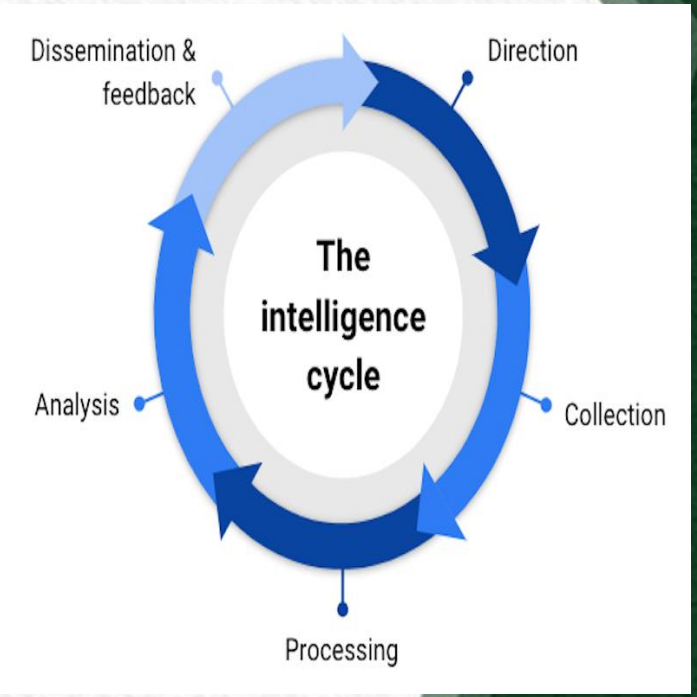

The Intelligence Cycle

Overview of the Intelligence Cycle

Continuous Process: The Intelligence Cycle is a dynamic, iterative process that drives all intelligence activities. It ensures a steady flow of information to meet evolving operational needs.

Support for Decision-Making and Operational Planning:

- In military contexts, it provides a structured approach to developing intelligence that informs strategic and tactical decisions.
- In EW operations, the cycle ensures timely and accurate intelligence to counter electronic threats and support mission objectives.

Intelligence is the product of knowledge and understanding of the terrain, weather, activities, capabilities and intentions of an actual or potential threat or any forces with which the Army is concerned.

INFORMATION – UNPROCESSED (RAW)

INTELLIGENCE – SEMI-PROCESSED - PROCESSED

The Intelligence Cycle

Stages of the Intelligence Cycle (ELO 2.1.2)

Key Stages:

1. Planning and Direction

Description: Establishing intelligence requirements and priorities, directing resources, and setting the stage for the intelligence process.

Purpose: Ensures that intelligence efforts are aligned with the mission's objectives.

2. Collection

Description: Gathering raw data and information from various sources, including human intelligence (HUMINT), signals intelligence (SIGINT), imagery intelligence (IMINT), and open-source intelligence (OSINT).

Purpose: Provides the raw material necessary for analysis.

3. Processing and Exploitation

Description: Converting collected data into usable formats through decryption, translation, and data sorting.

Purpose: Prepares the information for detailed analysis.

The Intelligence Cycle

4. Analysis and Production

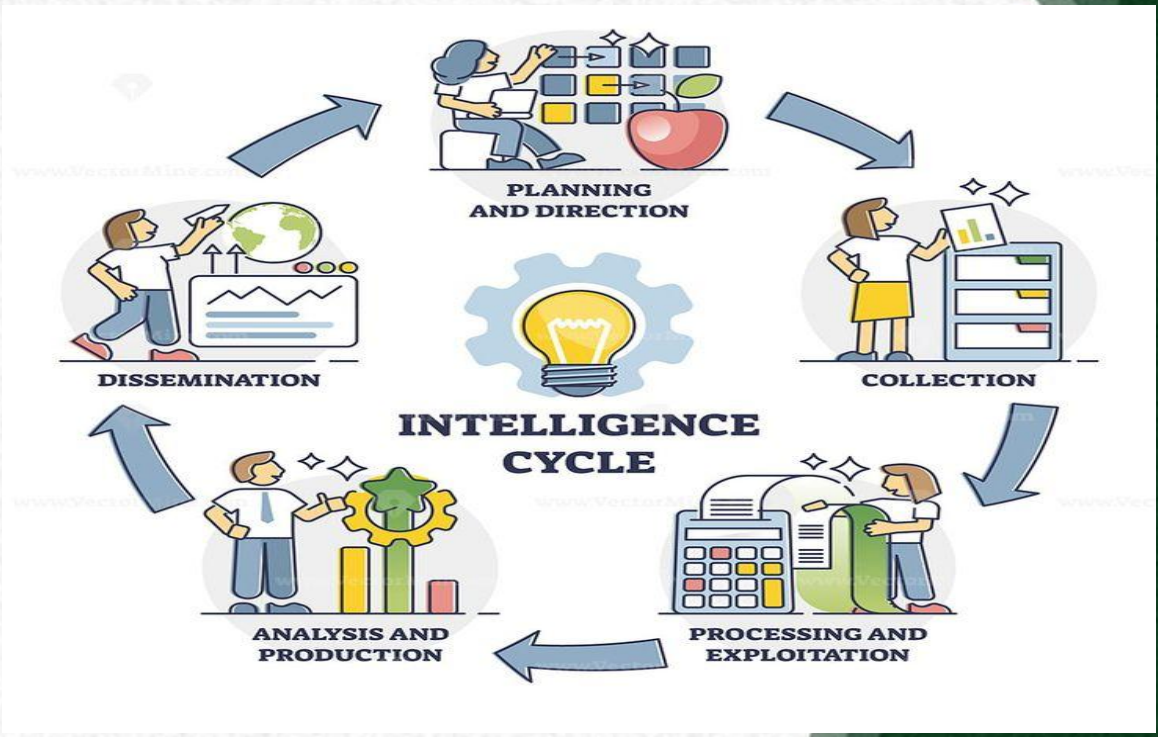

Description: Interpreting and synthesizing processed data to create actionable intelligence products, such as reports, briefings, and assessments.

Purpose: Transforms raw data into insights that can inform decision-making.

5. Dissemination and Integration

Description: Delivering the intelligence products to the relevant decision-makers and ensuring they are integrated into operational plans.

Purpose: Ensures that intelligence is available when and where it's needed to influence actions.

The Intelligence Cycle

Planning and Direction

Importance:

Establishing Intelligence Requirements:

- Identifying the specific information needed to support mission objectives.
- Setting clear priorities to focus efforts on critical intelligence gaps.

Prioritizing Tasks:

- Determining which intelligence activities are most urgent and allocating resources accordingly.
- Ensures that the most important intelligence needs are addressed first.

Directing EW Resources:

- Guiding Electronic Warfare (EW) assets to collect and process the necessary intelligence.
- Aligns EW efforts with broader operational goals and intelligence priorities.

Activities:

Defining EW Intelligence Needs:

- Assessing the operational environment to determine what intelligence is required for effective EW operations.
- Collaborating with commanders to understand their specific intelligence needs.

Allocating Resources:

- Distributing personnel, equipment, and other resources to maximize intelligence collection and analysis.
- Ensures that resources are used efficiently to meet intelligence objectives.

Tasking EW Assets:

- Assigning specific tasks to EW units or systems based on the identified intelligence needs.
- Coordinating the deployment of EW resources to ensure optimal coverage and effectiveness.

The Intelligence Cycle

Collection Methods and Techniques Methods in EW Context:

1.SIGINT (Signals Intelligence)

Description: Intelligence gathered from intercepting and analyzing electronic communications and signals.

Purpose: Identifies and monitors enemy communications, radar, and other electronic signals to assess capabilities and intentions.

2.ELINT (Electronic Intelligence)

Description: Intelligence derived from detecting and analyzing non-communication electronic emissions, such as radar and missile guidance systems.

Purpose: Provides insights into enemy electronic systems, including radar and electronic warfare systems.

3. COMINT (Communications Intelligence)

Description: A subset of SIGINT focused specifically on intercepting and analyzing communication signals.

Purpose: Provides information on enemy communications, including tactical and strategic discussions.

The Intelligence Cycle

Techniques:

Surveillance:

- **Description:** Continuous monitoring of electronic signals and communications to gather intelligence.
- **Purpose:** Provides ongoing situational awareness and detects changes in the electronic environment.

Interception:

- **Description:** Capturing electronic signals and communications as they are transmitted.
- **Purpose:** Enables the collection of data from enemy communications and electronic systems.

Signal Analysis:

- **Description:** Evaluating intercepted signals to extract useful information.
- **Purpose:** Determines the nature, origin, and significance of the signals, supporting decision-making and threat assessment.

The Intelligence Cycle

Processing and Exploitation
Objective:
Converting Raw EW Data into Actionable Intelligence

- **Goal:** Transform raw electronic warfare data into valuable intelligence that can be used for decision-making and operational planning.

Processes:
Signal Decryption:

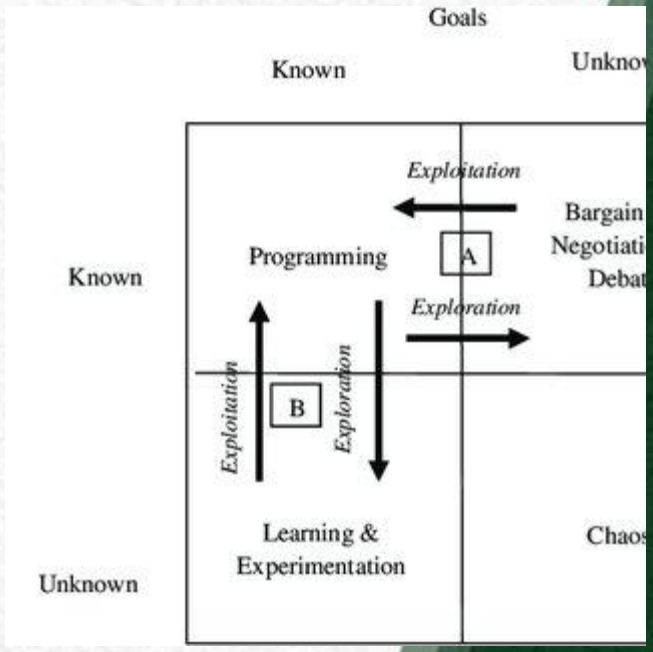

Description: Decoding encrypted signals to make the data accessible for analysis.

Purpose: Ensures that intercepted electronic communications and signals can be understood and utilized.

Data Interpretation:

Description: Analyzing and understanding the context and content of processed signals.

Purpose: Extracts meaningful information from raw data, such as identifying patterns or anomalies.

The Intelligence Cycle

Analysis and Production

Purpose:

Developing Intelligence Products from EW Data

- **Goal:** Convert processed data into actionable intelligence reports and insights that support operational and strategic decision-making.

Analysis Techniques:

Correlation:

Description: Linking different pieces of intelligence data to identify relationships and patterns.

Purpose: Helps to understand how various signals and information are interconnected, enhancing situational awareness.

Signal Pattern Analysis:

Description: Examining the characteristics and patterns of electronic signals to infer their source and purpose.

Purpose: Identifies and classifies signal types, sources, and potential threats.

Trend Analysis:

Description: Analyzing data over time to detect changes or emerging patterns.

Purpose: Predicts future developments and helps anticipate adversary actions based on historical data trends.

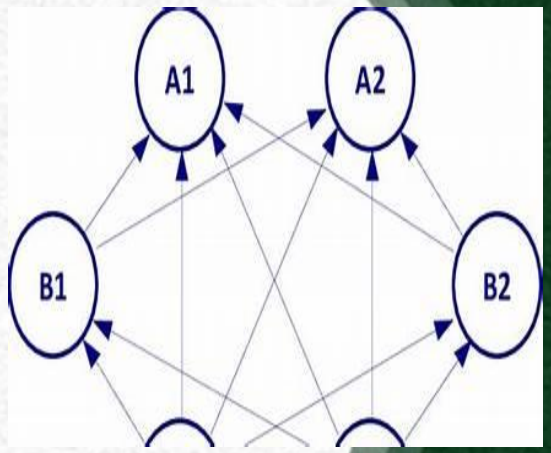

The Intelligence Cycle

Production:
Creation of EW Intelligence Reports and Briefings:

- **Description:** Compiling analyzed data into detailed reports and briefings.
- **Purpose:** Provides actionable insights and recommendations to decision-makers and tactical commanders.
- **Content:** Includes summary of findings, analysis, and actionable intelligence.

The Intelligence Cycle

Integration with Command and Control (C2) Systems

Role in C2 Systems:

Enhancing Situational Awareness and Decision-Making in EW Operations

- **Goal:** Ensure that intelligence from Electronic Warfare (EW) operations is effectively used to support command and control, improving overall situational awareness and decision-making capabilities.

Methods:

Integration of EW Intelligence into C2 Platforms:

Description: Incorporating EW-derived intelligence into command and control systems to provide real-time information and analysis.

Purpose: Enables commanders to make informed decisions based on comprehensive and current EW data.

Processes:

Data Sharing: Transmitting EW intelligence data to C2 systems.

Real-Time Updates: Providing continuous updates to maintain accurate situational awareness.

Visualization: Using C2 platforms to display EW data in a user-friendly format.

The Intelligence Cycle

Operational Security (OPSEC) and Ethical Considerations (ELO 2.1.9)
OPSEC: Protecting EW Intelligence from Adversaries
Objective: Safeguard Electronic Warfare (EW) intelligence to prevent adversaries from gaining insights that could undermine military operations.
Key Principles:

- **Information Control:** Limit access to sensitive EW data to authorized personnel only.
- **Secure Communication:** Use encrypted channels for transmitting EW intelligence.
- **Threat Awareness:** Regularly assess and mitigate potential security threats to EW data.

Ethical Considerations: Ensuring EW Activities Comply with Legal and Moral Standards
Objective: Conduct EW operations in a manner that adheres to legal and ethical norms.
Key Aspects:

- **Legal Compliance:** Follow national and international laws governing electronic warfare and intelligence activities.
- **Moral Standards:** Avoid actions that could harm civilians or violate ethical principles.
- **Transparency vs. Security:** Balance the need for operational security with the need for transparency in decision-making.

REFLECT

-Intelligence Cycle
-Stages of the Intelligence Cycle.
-Integration with Command and Control (C2) Systems
-Operational Security (OPSEC) and Ethical Considerations

LEARNING OUTCOME

By this time, students will apply the intelligence cycle concept and its relevance to EW operations during signal operations in accordance with PAM 6-00.

FEEDBACK

- Congratulate the learners for performing well
- Mention good performance
- Areas for improvement

FUTURE

Basic EW Support
