PHILIPPINE ARMY MANUAL 3-00

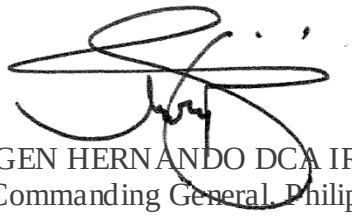

ARMY OPERATIONS

Philippine Army Manual 3-00 (PAM 3-00) dated 06 May 2014 is promulgated on authority of the Commanding General, Philippine Army

LTGEN HERNANDO DCA IRIBERRI AFP
Commanding General, Philippine Army

PREFACE

1. This document describes the emerging operational doctrine of the Philippine Army at the start of the 21st century. Based largely on the US Army Field Manual 3-0 (Operations) published in 2001 and revised in 2008, this document seeks to craft an appropriate doctrine for the Philippine Army in the conduct of its multifarious missions. Other references include the local doctrines and manuals of the AFP and the Philippine Army, and the Primer of the Joint Advanced Warfighting School (JAWS) in 2009 conducted by the Joint Forces Staff College under the US National Defense University.

2. The American doctrine on LAND POWER is the basis of the emerging Philippine Army doctrine on LAND DOMINATION that both use the framework of FULL SPECTRUM OPERATIONS as the operational concept. LAND DOMINATION in the Philippine context hopes to combine the strengths of FULL SPECTRUM OPERATIONS with the operational experiences of the Philippine Army. These experiences stem from our exposure in counter-insurgency and counter-secessionism operations in the Philippines since the late 1960's. Consequently, the underlying aim is to replace the AIR-LAND BATTLE DOCTRINE that the Philippine Army has adopted since the 1950's. The author must, however, point out that this doctrine does not pre-suppose that we must have the military might of the United States of America in terms of military hardware and technology before we can adopt the operational concept here in the local setting. This document is based on what capabilities we currently have and what we are capable of acquiring in the near future.

3. This document therefore would like to present this emerging doctrine for testing, ratification, and adoption not only by the Philippine Army leadership, but down to the Philippine Army's lowliest soldier as well. Comments, discussions, and corrections in the context of applicability and practicality in the Philippine setting are very welcome.

4. The purpose of this manual is to provide policies and guidelines for the conduct of Army Operations which aim to promote, guide, and direct operational principles in the sphere of Army Operations in support to national objectives.

5. The intention of this publication is to provide Army Personnel (Officers, EP and civilian employees) of all levels and in all units of the AFP a guide in the performance of their duties, functions and responsibilities.

6. This publication is scheduled for formal review on _____. Users are invited to submit recommendations for amendments, comments, and suggested improvements to this publication to the Office of the AC of S for Operations, G3, PA at Fort Bonifacio, Metro Manila or via e-mail at crssog3@yahoo.com. Feedbacks to this publication are also welcome telephonically via Bonifacio Telephone Exchange trunk line number 845-9555 or military local line number 6333.

Chapter I
The Philippine Army – Serving The People, Securing The Land

"You may fly over a land forever; you may bomb it, atomize it, pulverize it and wipe it clean of life - but if you desire to defend it, protect it, and keep it for civilization, you must do this on the ground, the way the Roman legions did, by putting your young men into the mud."

T. R. Fehrenbach
This Kind of War, 1963

The Foundation of the Philippine Army

0101. The Philippine Army's primary purpose is to serve the Filipino people. It protects and upholds the Philippine Constitution as well as its national interests. As the country's preeminent ground force, Army units must be prepared to defend against aggression, and swiftly and decisively win in combat. It must be ready to perform its mandate to fight the enemies of the nation in any level of conflict and perform other roles, anywhere and anytime. As in the past, the Army is and will remain dedicated to the Armed Forces of the Philippines' (AFP) mandate to protect the people, the sovereignty of the state and the integrity of the national territory. The Army's existence can only be justified by winning the nation's wars.

0102. The Philippine Army's commitment to the Filipino people is to defeat the enemies of the nation, to fulfill military responsibilities, and to support civilian authorities. As a significant component of national defense, the Philippine Army will assist the government in ensuring internal and external security as well as help in maintaining a climate for the continuation of a peaceful and stable way of life. The Army - both active and reserve components - must always be ready to undertake decisive actions and conduct operations anywhere in the archipelago, and to be part of a multinational peacekeeping force, anywhere in the world. It must also be efficient and effective in the performance of its roles as a partner in the development efforts of the civil government.

0103. As an institutional force, the Army organizes, trains, equips, maintains, and provides the Armed Forces of the Philippines, soldiers who are capable of fighting and winning battles and wars. As an operational force, the Army through its units, performs roles as partners in nation-building in times of peace and becomes a ready force capable of managing and maintaining stability during crisis. The Army develops its soldiers through rigorous and realistic training; the imparting of a sound doctrine; discipline, and proper motivation and orientation, resulting to well-motivated, tough and morally upright defenders of the State.

0104. It is an Army strengthened by an inspired leadership, a force mix that provides responsive, sustainable, versatile, flexible, and survivable land forces that are adaptable to the range of operations. Army forces conduct offensive and defensive

operations as well as those that provide support to civil governance. Their actions may include establishing foothold on land; conducting defensive fires and maneuver; closing in and destroying a determined enemy; sustaining a joint force; setting conditions for a return to self-sustaining peace; and, most important of all, securing the Filipino nation.

0105. The Philippine Army is intrinsically an internal defense force. It is not expeditionary in nature and is currently trained and equipped to operate domestically anywhere in the Philippines. It can, however, operate as part of a multinational coalition force committed to the attainment of regional and global peace.

Historical Overview

0106. For more than a century, the Philippine Army has served the Filipino people in times of peace and war. It draws inspiration from our national revolutionary heroes such as Andres Bonifacio, who were inspired by liberal ideas from Europe. Bonifacio founded the Katipunan to prepare the people for an armed revolution and started the fight against the better-armed Spanish colonizers. The Katipunan was the nucleus of the Revolutionary Army, and considered as the forerunner of the present-day Philippine Army. Following the outbreak of hostilities between the Filipino revolutionary forces and the Spanish troops, the Philippine Revolutionary Government and its Army was established on 22 March 1897 at Barrio Tejeros, San Francisco de Malabon, Cavite, with General ArtemioRicarte elected as Captain General. This is considered as the founding day of the Philippine Army.

0107. The Philippine Army was finally formally organized on the 15th of November 1935 under President Manuel Luis Quezon during the Commonwealth period. President Quezon sought the services of General Douglas McArthur, its only recognized Field Marshall, to craft a national defense plan. Accordingly, Commonwealth Act No.1, popularly known as the National Defense Act, was enacted into law. Executive Order No.11 provided the legal basis for the organization of an Army of the Philippines.

0108. When World War II broke out in 1941, two regular and ten reserve divisions of the Philippine Army undertook the defense of the Philippines. These divisions were incorporated into the United States Armed Forces in the Far East (USAFFE) under the command of General McArthur. Various reserve units were mobilized and mandated to augment the regular force. Together, Filipino and American forces fought the Japanese invaders. Joint RP-US conventional resistance may have ceased but Filipinos continued their armed struggle using guerrilla tactics, until the return of the American forces, which spelled the defeat of the Japanese forces on July 5, 1945.

0109. After the war, the Armed Forces activated four military areas to take the place of military districts. The Armed Forces was reorganized which gave birth to the four major services. Then the Army was reactivated and reorganized enabling it to play a crucial role in the nation's rehabilitation efforts. The following years saw the significance of the Philippine Army in the neutralization of the Huk rebellion in Central Luzon.

0110. In the early fifties and the mid-sixties, the Philippine government extended a helping hand to war-torn South Korea and South Vietnam in the fight against communism designed to uphold the struggle for democracy. The Army spared five battalions that comprised the Philippine Expeditionary Forces to Korea (PEFTOK) to fulfill its international commitment and sent the Philippine Civic Action Group (PhilCAGV) to South Vietnam on a peace mission providing technical and medical services.

0111. In the seventies, the Army was virtually confronted with war on two fronts: the communist insurgents in Luzon and the Muslim secessionists in the Mindanao. On 21 September 1972, Martial Law was declared. It was during this critical period in the history of the country that the Philippine Army assumed the responsibility of enforcing the laws of the land. To achieve greater flexibility and power, Infantry divisions took the place of the military areas. During the following decade, military operations supported by civic action blocked the escalation of threats to national security.

0112. The eighties and nineties saw the Philippine Army actively assuming multi-faceted roles in addition to its primary role as defender and guardian of the state. The numerous counter-insurgency campaigns aimed at isolating the insurgents from the civilian population meant that the Army must have an active participation in national development. During these periods, military operations resulted in the granting of selective amnesty brought about by the government's greater sensitivity to the plight of Muslim Filipinos in Mindanao while conducting its anti-secessionist operations.

0113. The Philippine Army has always been a partner in the growth of the Filipino nation. In its many engagements, it has kept its role not only as the protector of the Filipino people, but also a partner in nation building. The Army has significantly helped steer the course towards the formation of Filipino nationhood.

0114. The Philippine Army reflects the time-honored heritage and respectable tradition of Filipino soldiery tempered through time by its commitment to attain national objectives. It remains culturally sensitive to the Filipino people's pursuit of a democratic way of life. Throughout history, the Philippine Army expands its roles and missions to realize the emboldened responsibility of the Armed Forces of the Philippines as the protector of the people and the state.

The Legal Basis of Philippine Army Operations

Constitutional Provisions

0115. The Philippine military establishment is charged to "provide for the common defense" of the country. In the State Principles and Policies of the 1987 Constitution, the Philippines, as a State Policy, *renounces war as an instrument of national policy as well as adopts the generally accepted principles of international law as part of the*

law of the land and adheres to the policy of peace, equality, justice, cooperation, and amity with all nations. (Art II Sec 2) Furthermore, it establishes the principle that,

"Civilian authority is, at all times, supreme over the military. The Armed Forces of the Philippines is the protector of the people and the State. Its goal is to secure the sovereignty of the State and the integrity of the national territory." (11.3)

0116. The framers of the Constitution specified that Congress alone would have the power to raise and support armies as well as declare war:

"The Congress, by a vote of two-thirds of both houses in joint session assembled, voting separately, shall have the sole power to declare the existence of a state of war. In times of war or other national emergency, the Congress may, by law, authorize the President, for a limited period and subject to such restrictions as it may prescribe, to exercise powersnecessary and proper to carry out a declared national policy. Unless sooner withdrawn by resolution of the Congress, such powers shall cease upon the next adjournment thereof" (VI.23 (1) (2))

The Chain of Command

0117. The Constitution further provides that the President, as the nation's Chief Executive, shall be the Commander-in-Chief of the Armed Forces of the Philippines. This authority, coupled with the treaty-making authority, the appointive power-including the appointment of the officers of the Armed Forces, and the requirements to "take care that the laws be faithfully executed", are the constitutional bases for presidential guidance and direction of national security affairs. Thus, the responsibility for providing the nation's defense through the Armed Forces of the Philippines is constitutionally shared by the civilian officials in the legislative and executive branches of the government.

0118. The Secretary of National Defense is an appointed cabinet member. He is a civilian adviser of the President on matters concerning defense and strategy. He directs the national defense program of the country and has executive supervision over the AFP in the implementation of national defense policies. He ensures that the AFP adheres to national policies as determined by civilian leaders. He also ensures that the AFP is capable of accomplishing its roles and mandates by continuously pushing for programs to improve AFP capabilities.

0119. The Chief of Staff is the principal military adviser of the President, the National Security Council, and the Secretary of National Defense. The Chief of Staff executes the President's command functions in relation to military strategy, operations and tactics. Through the Chief of Staff, the President issues orders to all AFP commanders.

0120. The President as Commander-in-Chief, the Secretary of National Defense and the AFP Chief of Staff compose the AFP's National Command Authority (NCA). They direct the AFP and its major services and unified commands in the execution of defense policies and security tasks.

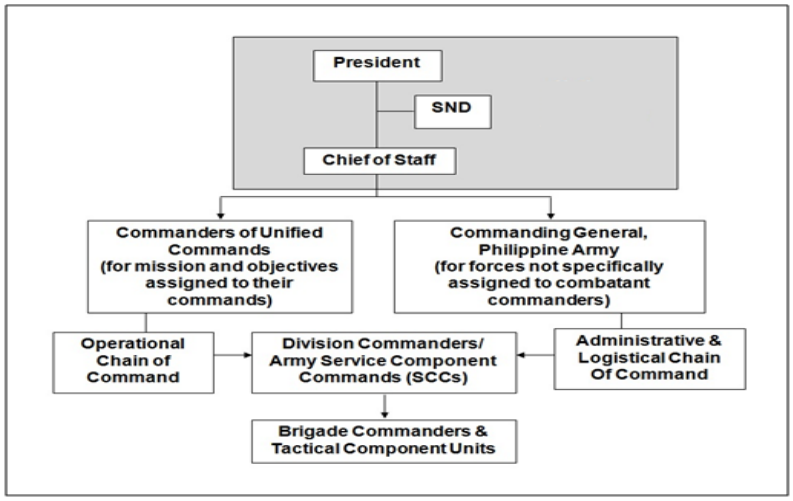

Figure 1.1 - The AFP Chain of Command

0121. The roles and relationships of these different main elements of the Philippines defense establishment are presented in the following table:

Position	Role
The President, as Commander-in-Chief	Commands the Armed Forces
Secretary of National Defense	Responsible for Defense Policy Directions
Chief of Staff	Strategic Military Guidance, Strategy and Directions
Major Services	Manage and Develop the Forces
Unified Commands	Employ the Forces

0122. The tasks of employing, managing and/or developing the force are so important and distinct that they have to be performed by two separated entities. The major services create, manage and develop the force; the unified commands employ the forces.

The Defense Strategic Management Framework

0123. The government manages and administers the country's defense resources through a Defense Strategic Management Framework executed by the Department of National Defense (DND). The DND integrates the use of military forces and their potential together with other instruments of national power that resides with the other agencies of government. The AFP is the largest bureau under the DND, which is at the same level as the Government Arsenal (GA), the National Defense College of the Philippines (NDCP), the Philippine Veterans' Affairs Office (PVAO), and the Office of Civil Defense (OCD).

0124. Currently, it is the DND's mission to integrate all defense resources to guard against external and internal threats to national peace and security, and promote the welfare of soldiers, veterans and their families, in order to promote national security,

uphold the country's sovereignty and territorial integrity, and support socio-economic development, and political stability. Its functions are to:

a. Formulate, develop & promote policies, plans, programs & projects in the field of defense, & in coordination with the National Security Council (NSC), in the field of security;

b. Direct, plan and supervise the national defense program;

c. Undertake research and studies to ensure the effective implementation of the national defense plan and other related programs and projects;

d. Exercise supervision & control over the AFP, GA, NDCP, PVAO & OCD;

e. Supervise the setting of standards, accreditation & furnishing of technical assistance to institutions, organizations, corporations & persons engaged in emergency management or related development activities requiring defense & military assistance; and,

f. Advocate for and disseminate information on defense security issues.

Defense Program Structure

0125. In order to carry out its functions, DND has to optimize the administration and operationalization of our defense resources through the three-tiered Defense Program of the DND-AFP (See Figure 1.1) composed of several programs, sub-programs and program elements. This programs form the basis of budget allocations from the national government. The programs, which are force/capability-based are:

a. **Program 1- Land Forces**. (Commanding General, Philippine Army as Program Manager)

b. **Program 2 - Air Forces**. (Commanding General, Philippine Air Force as Program Manager)

c. **Program 3 - Naval Forces**. (Flag Officer in Command, Philippine Navy as Program Manager)

d. **Program 4 - Joint C2, Support and Training**. (Chief of Staff, AFP as Program Manager)

e. **Program 5 - DND-level central administration and support**. This shall be comprised of the Civilian Bureaus.

0126. The sub-programs, which are referred to as Defense Mission Areas (DMAs), are defense mission-based sub-programs that are common to all the force/capability-based programs. They are:

a. **DMA1 - Territorial Defense, Security and Stability**. Secure the sovereignty of the state and the integrity of the national territory (Sec 3, Art II, 1987 Constitution); secure the Republic of the Philippines from direct armed aggression or invasion (RA 7898 – AFP Modernization Law); secure the national territory from all forms of intrusion and encroachment (RA 7898); suppress insurgency & other serious threats to internal security / combat terrorism (Sec 3, RA 8551); and, assist in social and economic development (EO 292, S' 87 / 1987 Admin Code).

b. **DMA 2 - Humanitarian Assistance and Disaster Risk Reduction**. Protect and preserve life and property in times of war or other national emergencies of equally grave character (natural and man-made disasters/ calamities) (RA 7898).

c. **DMA 3 - International Engagements and Peace Support Operations**. Strengthen security alliance and partnership in the Asia-Pacific Region (RA 7898 - AFP Modernization Law); Remain engaged with key defense and security partners; Assist in fostering international peace and stability (Chapter VI & VII, UN Charter); and, contribute to international peace & security.

d. **DMA 4 - Force-level C2, Training and Support**. Provide support to the three (3) mission areas (RA 7898 - AFP Modernization Law).

0127. Program elements compose the different units of the Armed Forces which will be as many as necessary to carry out the roles in each of the sub-programs or DMAs, in compliance to the Secretary of National Defense's (SND's) centralized policy guidance. In effect, DND will facilitate the tracking and relating of resources and objectives to actual performance against established objectives of each of the program elements, from programming through the end of the budget year. From the Defense Mission Areas (DMAs) (See Figure 1-2), the Philippine Army derives six (6) operational environments**,** and these are; Internal Security (IS), Territorial Defense (TD), Disaster Risk Management (DRM), Support to National Development (SND), International Defense and Security Engagements (IDSE); and, Humanitarian Assistance and Peacekeeping (HA/PK). (See Section 2-5)

0128. Every DMA has its own set of dynamics, complexities, stakeholders, resources and planning considerations that every army force commander will consider for him to succeed.

0129. Particularly, each DMA will require its own Intelligence Preparation of the Operational Environment (IPOE). This therefore implies that a total army force must be able to operate in all of the DMAs, notwithstanding the availability of the required resources for each DMA. Commanders will have to capitalize on the formulation of robust concepts of operations attuned to the complexities of each of the DMA, and in concert with other agencies. In some cases, an army or joint force may operate in two or more DMAs at the same time, with the same set of resources.

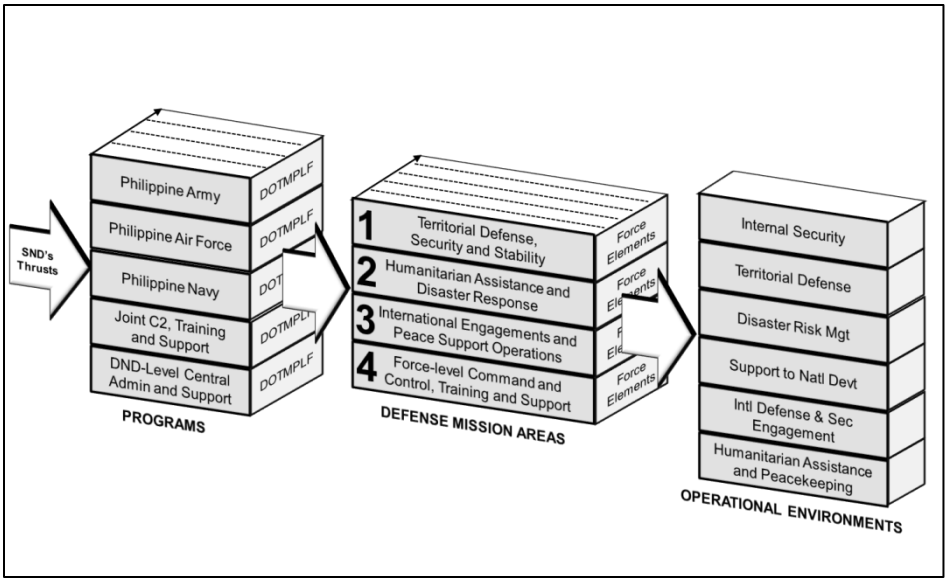

Figure 1.2 - The Three-tiered DND-AFP Defense Program

Defense System of Management

0130. DND Circular Number 05 dated 19 September 2008 mandates the adherence to the Defense System of Management (DSOM) that will guide the Department of National Defense and its bureaus – with the AFP as its largest bureau, in its Strategic Management Decision Process. It is the overarching system of systems that links capability development strategy to planning, programming, budgeting, execution and performance review. It is designed to provide a systematic basis for:

a. Determining RP's defense needs, requirements and priorities, and allocating defense resources;

b. Developing fiscally constrained plans, programs and budgets that meets the most important defense capability needs; and,

c. Explaining the logic of plans, budgets, and the risks involved to the President and Congress.

0131. The Philippine Army, as an institutional force, must be adept and cognizant of its valuable role in the Strategic Management Decision Process since it will be the recipient of the initiatives of this process. Ultimately, it will make the Army, and the other services and components of DND, more responsive to the various roles which they must undertake in the different DMAs. Significantly, the Army's ability to plan out robust operations that are responsive to security problems in specific localities must point out the needed resources that will have to be identified, sourced, procured and utilized, to boost the chances of mission success. In effect, needed capabilities, gaps and emerging requirements will have to pass through this process before Army forces can use them in their operations.

0132. The DSOM is composed of the following mutually supporting component systems:

a. **The Defense Strategic Planning System (DSPS).**It develops strategic assessments that address current and emerging threats and future concerns in each defense mission area. It also develops strategic plans that accomplish national-level security issues that require "whole of government" interagency approaches.

b. **The Defense Capability Assessment and Planning System (DCAPS).**It develops detailed capability plans that support approved strategic plans, SND-directed tasking, operationally-oriented mission area assessments, and capability planning proposals.

c. **The Defense Acquisition System (DAS).**It provides a coherent framework for conducting and managing AFP and civilian bureau acquisition efforts. It collaboratively develops acquisition assessments and financially realistic procurement plans that meet identified capability requirements in a timely manner and at a reasonable price. It operates in accordance with R.A. 9184 (Government Procurement Act).

d. **The Defense Resource Management System (DRMS).**This has two components: the Planning, Programming and Budgeting System (PPBS) and the Financial Management System (FMS). They provide a coherent and analytically-oriented framework for issuing defense policy and resource planning directions by the SND. They assist decision-making in allocating limited resources among competing priorities across the spectrum of defense activities. They also evaluate results achieved against established programmatic and financial management objectives.

Chapter II
The Land Domination Doctrine (LDD)

"I have known that what our combat units need are physically strong, well-trained, well-motivated, skilled and well-equipped soldiers – soldiers with big fighting hearts, convinced of the nobility of their mission and who have the willing desire to sacrifice; soldiers who will not only survive but will emerge victorious and triumphant against the threats to our nation's well-being and security."

LtGenGeneroso S Senga

Philippine Army Warfighting Philosophy

0201. Army forces are the decisive component of land warfare in joint and multinational operations. The Philippine Army organizes trains, equips, controls and manages its forces to fight and win the nation's armed conflicts and achieve directed national objectives from the civilian leadership.

0202. Fighting and winning the nation's armed conflicts are the foundations of Army service - the Army's non-negotiable contract with the Filipino people and its enduring constitutional obligation to the Filipino nation. As such, Philippine Army forces are always expected to **DOMINATE** its operational environment to ensure success within the Philippine territory or in some other foreign land as part of a multinational coalition and sanctioned by international law. Again, the Philippine Army is not an expeditionary force. Its current focus is primarily for the defense of its sovereignty by dominating the situation on land. It is done for the purpose of enabling civil governance, both national and local, to function effectively and efficiently.

0203. Because Army forces fight and win the nation's armed conflicts, they also deter them. The object of deterrence is to impose the will of the state and non-state political and military leaders on potential hostile entities within our territory, foreign or domestic. Deterrence establishes in the minds of potential adversaries that their actions will have unacceptable consequences. Army forces deter by threatening these hostile forces' means of power usurpation and population control, with the ability to engage in decisive combat in order to seize and occupy hostile force base areas. Army forces, poised for action, signal the unquestioned commitment of the Philippines to fight and win if deterrence fails.

0204. Deployed, combat-ready Philippine Army forces reassure allies and the Filipino people in general, as they deter potential enemies. The presence of Army forces usually contributes more to the situation than their potential combat power. Army forces on the ground demonstrate that the Government of the Republic of the Philippines (GPH) is willing to win the peace. It is committed to secure the nation's patrimony and territory with military power against all threats, foreign or domestic. Historically, security brings opportunity for stability, and with it, the potential for economic and political development. The Filipino people and Philippine Army both benefit directly from the cooperation that continuous contact makes possible.

0205. The Army's war fighting focus produces a full spectrum force that meets the needs of unified and joint force commanders (UCs/JFCs) in war, conflict, and peace. In war, Army forces form the nucleus of the joint force land component - imposing the nation's will on a hostile force and causing his collapse. In conflict, Army forces deploy quickly into an area of operations (AO) to deter adversaries and potential enemies from establishing their influence and preclude them from gaining an operational advantage. If deterrence fails, Army forces defeat the hostile force, end the conflict on terms that achieve national objectives, and establish self-sustaining post-conflict stability. Early movement of Army forces retains initiative and freedom of action by providing UCs complementary means of conducting decisive offensive operations at times and places of their choosing. If circumstances require, Army forces block a hostile force's offensive and deliver the counteroffensive blow necessary to win as rapidly as possible. In peace, Army forces train for war. They also help shape the international security environment through peacetime military engagement (PME) activities. Philippine Army forces help civil authorities prepare for and respond to natural or manmade disasters as well.

The Philippine Army Mission Essential Tasks

0206. The Philippine Army's mission essential task lists (METL) is derived from statutory requirements, operational experience, strategies for employing military forces, and operational requirements of the combatant commanders. They are the operational expression of the Army's core competencies contained in PAM 01. Although these tasks are termed the Army METL, all Army units develop their own situation-focused METLs. To perform the Army METL tasks, the Army continuously integrates doctrine, organization, training, materiel and logistics, personnel, leader development, and facilities (DOTMPLF).The Philippine Army Mission Essential Tasks are: Shape the Security Environment; Dominate Land Operations; Respond Promptly to Crisis; Mobilize and Train the Reserve Army; and Provide Support to Civil Authorities.

0207. The Army METL tasks describe what well-trained, superbly led, and well-equipped soldiers do for the nation. They state what the Army does so the nation can use its military power effectively across the full spectrum of operations in war, conflict, and peace. While focused on the land dimension, Army forces complement other service forces in unified action. The ability of Army forces to perform these tasks generates the credible land power necessary for UCs to preclude and deter hostile threat force action, win decisively if deterrence fails, and establish a rapid return to sustained post-conflict stability. Thus, Army forces expand a UC's range of military options in full spectrum operations. Full spectrum operations are the range of operations Army forces conduct in war and military operations other than war.

Shape the Security Environment

0208. The national security and national military strategies establish an imperative for engagement. The Philippines will remain politically and militarily engaged in the

world and will always strive to achieve military superiority over potential adversary. Engagement elevates to mission status the role of the Armed Forces of the Philippines in shaping a domestic, regional and international environment that promotes and protects Philippine national security interests, before the threat of conflict arises. Participation in international defense and security engagements, peacekeeping operations and humanitarian assistance operations enhance the ability of Philippine Army forces to engage other nations - their people, governments, and militaries.

0209. Philippine Army forces pursue engagement through presence on the ground and PME activities. Army forces conduct PME activities anywhere in the Philippines and in other nations through alliance and coalition operations. Through PME, Army forces contribute significantly to promoting domestic, regional and global stability, reducing potential conflicts and threats, and deterring aggression and coercion.

0210. Domestic PME activities are proactive, opportunity-based endeavors conducted at selected areas within the Philippine archipelago to shape the local security environment in the advancement of national interests. Regional and international PME activities, on the other hand, strengthen alliances and coalitions, and foster the development of democratic institutions. Working with allies and potential coalition partners, Philippine Army forces foster bilateral and multilateral relationships, increase military openness, enhance cooperation, and advance regional and international conflict prevention and resolution mechanisms.

0211. By conducting domestic PME activities, Philippine Army forces continually help unified commanders shape their areas of responsibility (AORs). In this context, PME activities are developmental operations directed within a unified commander's campaign plan. As such, they are planned and conducted like any other military operation. Army forces, especially Army engineering and health support units, are well suited for PME missions.

0212. Other PME activities are directed at potential adversaries. Those activities reduce the potential for instability and conflict in concert with leading allies by discouraging arms races, countering the proliferation of weapons of mass destruction (WMD), combating terrorism, and deterring aggression. The involvement of Philippine Army forces performing these PME activities provides a visible sign of Philippine commitment to peace and stability.

Dominate Land Operations

0213. For war and contingencies to be decisive, its outcome must be conclusive. Philippine Army forces today are the preeminent land forces in the Philippines. That pre-eminence translates into the ability to dominate land operations - the decisive complement to air and sea operations. The threat or use of Army forces is the ultimate means of imposing the nation's will and achieving a lasting outcome. Land operations seize the initiative against hostile forces, bases and resources, destroy his armed capability, and eliminate his means of controlling and influencing the population. Only land forces can exercise direct, continuing, discriminate, and comprehensive control over land, people, and resources.

0214. Ultimately, it is the ability of Army forces to close with and destroy the hostile force that allows the Army to dominate land operations. Army forces close with and destroy hostile forces through maneuver and precision direct and indirect fires. An adaptive hostile force attempts to lessen the effects of operational fires. However, with their inherent qualities of on-the-ground presence and situational understanding, Army forces make permanent the otherwise temporary effects of fires alone. Domination extends from the certainty in the minds of hostile force commanders that close combat with Army forces, backed by air and naval forces will have two outcomes - destruction or surrender.

0215. Sustained land operations establish the conditions required for long-term national objectives. Army forces can conduct sustained, large-scale full spectrum operations throughout the area of operations. Army forces are inherently durable, self-sustaining, and self-replenishing. This endurance allows them to remain in an area of operations as long as the national command authorities (NCA) require. Faced by an enemy capable of prolonged resistance, Army forces create and maintain conditions that lead to the hostile force's ultimate defeat.

0216. Philippine Army operational-level organizations include divisions, Army service component commands (ASCCs), and other functional and multifunctional regiments. These organizations are resourced, trained, and equipped to dominate opposing land forces, control vast land areas, assist in the governance of occupied areas, and control populations and resources. Their capabilities include operational and tactical maneuver and fires; command and control (C2) of Army and joint forces; intelligence; military and civil engineering; and sustainment support (SS). These capabilities include unconventional warfare, rapidly deployable direct action operations, information operations (IO), special reconnaissance, counterterrorism and civil military operations (CMO) that include public affairs (PA), civil affairs (CA), and Information Support Affairs (ISA).

0217. Robust operational support and sustainment support to the joint force make sustained land action possible. Key Army operational-level support organizations include Army operational and sustainment support commands that provide transportation (ground lift), supply, engineer, chemical, finance, medical, intelligence, and personnel support units and services. These organizations give Army force commanders the functional expertise and C2 capabilities necessary to provide sustained support to the joint force. If necessary, they expand to provide the support required for each phase of the UC's campaign.

0218. The Army also maintains the structure and expertise necessary to develop, acquire, and supply the equipment and supplies for full spectrum operations. In addition to supplying Army forces, the Army manages certain commodities, such as conventional ammunition, for all services. It also maintains the research and development capabilities and linkages to local and international suppliers that give Army forces the best equipment possible.

Respond Promptly to Crisis

0219. UCs and Army units organize actions in time and space to present a hostile force with simultaneous, multidimensional threats - land, air and sea. The strategic responsiveness of Army forces adds dominance of the vital land dimension to the capabilities of joint forces. In today's environment, potential enemies understand the dynamics of dimensional combat. They will attempt to sequence their activities while consolidating their position before significant land forces can defeat them. Responsive Army forces give UCs the ability to conduct operational and tactical maneuver on land early in the operation. Operational and tactical maneuver provides the basis for Army forces to seize and retain the initiative and dictate the terms of land combat. Prompt response increases the magnitude of the hostile force's dilemma exponentially. It allows the UC to apply military power in complementary and asymmetric ways. This allows the joint force to quickly build and maintain momentum and win decisively.

0220. Army forces respond to crises in all environments. They are versatile enough to dominate any situation. Army commanders tailor and train forces to react quickly to any crisis, regardless of its nature or the circumstances.

Mobilize and Train the Reserve Army

0221. The Army maintains the ability to mobilize and train the nation's land force reserve forces to meet national contingent needs or the requirements of war or national emergencies, as mandated by existing laws. The Army should also have the facilities, equipment, systems, procedures, and manpower necessary to generate sustained combat power from these forces rapidly and effectively.

0222. It is impossible to guarantee that active component forces will always be properly configured or sufficiently manned and equipped to meet either unexpected contingencies or the requirements of sustained land combat. Providing the means to expand the Army ensures that the National Command Authorities (NCA) can confront unforeseen threats to national security. Integrated approaches to DOTMPLF ensure that all Army components stand trained and ready for action.

Provide Support to Civil Authorities

0223. Army forces adapt and tailor their warfighting capabilities using full spectrum operations to complement and support civil authorities and agencies. In times of need, Army forces provide support and expertise to reinforce or fill critical requirements beyond the immediate capabilities of civil authorities and agencies. The presence of trained and ready Army forces, both active and reserve, contributes to the security and defense of the country. The Army can rapidly respond to natural or manmade disasters as well as threats to security because it possesses a robust and diverse force structure, and maintains a substantial physical presence throughout the archipelago.

Prompt Army assistance to civil authorities is often a decisive element in disaster relief and crisis resolution. Army forces continue sustained support until civil authorities no longer require military assistance.

Doctrine and the Philippine Army

0224. Doctrine is the concise expression of how Army forces contribute to unified action in campaigns, major operations, battles, and engagements. While it complements joint doctrine, Army doctrine also describes the Army's approach and contributions to full spectrum operations on land. Army doctrine is authoritative, but not prescriptive. Where conflicts between Army and joint doctrine arise, joint doctrine takes precedence.

0225. Doctrine touches all aspects of the Army. It facilitates communication among soldiers no matter where they serve, contributes to a shared professional culture, and serves as the basis for curricula in the Army Education System. Army doctrine provides a common language and a common understanding of how Army forces conduct operations. It is rooted in time-tested principles, but is forward-looking and adaptable to changing technologies, threats, and missions. Army doctrine is detailed enough to guide operations, yet flexible enough to allow commanders to exercise initiative when dealing with specific tactical and operational situations. To be useful, doctrine must be well known and commonly understood.

0226. As the Philippine Army's keystone operations manual, this manual provides the principles for conducting operations. It describes the Army's operational-level role of linking tactical operations to strategic aims and how Army forces conduct operations in unified action. This manual bridges Army and joint operations doctrine. It also links Army operations doctrine with Army tactical doctrine.

The Spectrum of Conflict

0227. The spectrum of conflict is the backdrop for Army operations. It places levels of violence on an ascending scale marked by graduated steps. (See Figure 2-1.) The spectrum of conflict spans from stable peace to general war. It includes intermediate levels of unstable peace and insurgency. In practice, violent conflict does not proceed smoothly from unstable peace through insurgency to general war and back again. Rather, general war and insurgencies often spark additional violence within a region, creating broad areas of instability that threaten national vital interests. Additionally, the level of violence may jump from one point on the spectrum to another. For example, unstable peace may erupt into general war, or general war may end abruptly in unstable peace. Therefore, the four levels are not an exclusive set. Nonetheless, the spectrum of conflict provides a tool to understand and visualize the level of violence and the corresponding role of the military in resolving a conflict.

0228. Army forces affect the operational environment as they operate to accomplish their mission. Commanders seek to establish conditions favorable for conducting subsequent operations and tasks. They consider not only their follow-on missions but also how to restore a stable peace. If stable peace is not readily attainable, commanders design operations so that in the end, they lower the violence level as much as possible. When operating anywhere on the spectrum, commanders and staffs consider how to move the level of violence toward stable peace.

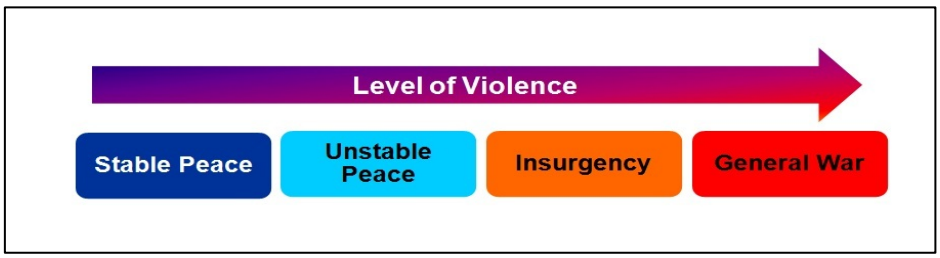

Figure 2.1 - The Spectrum of Conflict

0229. Military power cannot, by itself, restore or guarantee stable peace. It must, however, establish regional and local conditions that allow the other instruments of national power—political, informational, cultural and economic—to exert their full influence. This creates avenues for diplomacy to resolve disputes. On a local level, an Army task force suppresses terrorism and lawlessness so other government agencies can work freely with local officials to restore self-sustaining governance. In each case, achieving stable peace requires expertise and capabilities beyond those developed in the military force. Every use of military force to restore stable peace requires the other instruments of national power. Conversely, efforts by other instruments of national power to restore a stable peace are usually futile unless backed by effective military power, military power with regional reach and endurance. In every campaign and major operation, success, as characterized by a stable peace, depends on unified action involving concerted efforts by joint military and civilian partners.

Stable Peace

0230. Stable peace is characterized by the absence of militarily significant violence. Activities of actors (such as national government agencies, local government units, corporations, and nongovernmental organizations) are confined to peaceful interaction in politics, economics, and other areas of interest. Peaceful interaction may include intense competition as well as cooperation and assistance. While tensions do exist, all recognize that their interests are best achieved by means other than violence.

Unstable Peace

0231. When one or more parties threaten or use violence to achieve their objectives, stable peace degenerates into *unstable peace*. Unstable peace may also result when violence levels decrease after violent conflict. In some cases, the Army maybe

directed to apply force to limit conflict. Preventing a return to violent conflict may require peace operations. Sometimes stable peace is not immediately achievable. At those times, the goal of conflict termination is establishing conditions in which peace operations can prevent conflict from recurring. Doing this allows the instruments of national power to work toward stable peace.

Insurgency

0232. An insurgency can be defined as an organized movement aimed at the overthrow of a constituted government through the use of subversion and armed conflict. It is a condition of politically motivated conflict involving significant intra- or interstate violence but usually short of large-scale operations by opposing forces. Insurgencies often include widespread use of irregular forces and terrorist tactics. An insurgency may develop in the aftermath of general war or through degeneration of unstable peace. Insurgencies may also emerge on their own from chronic social or economic conditions. Intervention by a foreign power in an insurgency may increase the threat to regional stability.

General War

0233. It is armed conflict between major powers in which the total resources of the belligerents are employed, and the national survival of a major belligerent is in jeopardy. General war usually involves nation-states and coalitions; however, civil wars may reach this level of violence. In general war, large and heavily armed conventional forces fight for military supremacy by conducting major combat operations. These operations aim to defeat the adversary's armed forces and eliminate the enemy's military capability. These conflicts are dominated by large-scale conventional operations but often include asymmetric warfare.

The Spectrum of Conflict, Operational Environments and Army Forces

0234. From the Defense Mission Areas (DMAs) (See Figure 1-2), the Philippine Army derives six (6) operational environments that total army forces must be adept in and prepared for. These are the "areas of expertise" where Army power will be used to achieve political strategic ends, either as an independent force or part of a joint force.

a. **Internal Security (IS)** – Suppresses insurgency & other serious threats to internal security; and, combat terrorism.
b. **Territorial Defense (TD)** –Secures the sovereignty of the state and the integrity of the national territory from direct armed aggression or invasion and

secures the national territory from all forms of intrusion and encroachment by foreign adversary.

c. **Disaster Risk Management (DRM) -** Engages in activities and programs to protect and preserve life and property in times of war, disasters and calamities; and, other national emergencies of equally grave character whether natural or man-made.

d. **Support to National Development (SND)** – Actively contributes in social and economic development.

e. **International Defense and Security Engagements (IDSE)** – Engages in activities and programs that strengthen security alliance and partnership in the Asia-Pacific Region; and continues to engage with key defense and security partners.

f. **Humanitarian Assistance and Peacekeeping (HA/PK)**– Assists in fostering international peace and stability; and contributes to international peace & security.

0235. These operational environments will determine how joint and army forces will apply full spectrum operations – which can also be referred to as operational themes - to attain strategic objectives. They will also dictate how the Army forces will train in order to carry out their mandates effectively and efficiently.

0236. Army forces operate anywhere on the spectrum of conflict, in any of the mandated operational environments. In each case, achieving the end state requires reducing the violence level and creating conditions that advance national strategic goals. Commanders conduct a series of operations intended to establish conditions conducive to a stable peace. Some situations require applying massive force in major combat operations to eliminate a threat; others involve applying military power to reduce an insurgency to a size the police forces can defeat. The goal at any point is to move conditions to a lower level of violence; however, avoiding intermediate levels is desirable. When this is not possible, commanders seek to move the situation through them to stable peace as quickly as possible.

0237. Today's operational environments require Army forces to continuously evaluate and adapt their tactics to ensure that they are appropriate. Recent experience demonstrates the difficulty and cost of fighting terrorists and insurgents while supporting development efforts. These experiences and a study of other conflicts have revealed insights that are guiding the Army's effort to prepare for future operations:

a. All major operations combine offensive, defensive, and other types of operations executed simultaneously at multiple echelons.

b. The operational environment evolves over time and changes due to military operations.

c. Operations conducted during one phase of a campaign or major operation directly affect subsequent phases. Commanders should conduct current

operations in a manner that sets the conditions necessary for future operations - and ultimately allowing the other instruments of national power to secure a stable peace.

d. Major operations are conducted not only to defeat the enemy but also to restore a stable peace. The military plays a large role in this effort, even after major combat operations have ended. Restoring a stable peace after a violent conflict may take longer and be more difficult than defeating enemy forces.

e. In any campaign or major operation, changing conditions require Army forces to adapt their tactics, techniques, and procedures (TTPs) to the operational environment. To be successful, leaders must develop learning organizations that collect and share best practices and lessons learned.

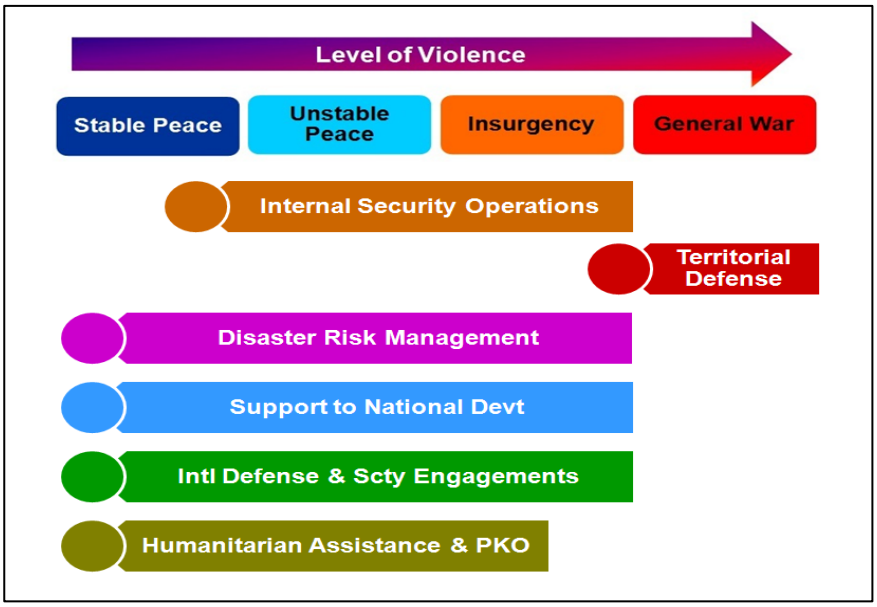

Figure 2.2 - The Spectrum of Conflict and the Operational Environments

Dimensions of Philippine Army Operational Environments

0238. The operational environment within which the Philippine Army operates in has six dimensions. Each affects how Army forces combine, sequence, and conduct military operations. Commanders tailor forces, employ diverse capabilities, and support different missions to succeed in this complex environment. The Dimensions of the Operational Environment are threat, political, unified action, land operations, information and technology.

The Threat Dimension

0239. The potential for armed conflict within the country and the growing threat of disruptions in public safety and security by insurgent and terrorist groups remain to be

serious challenges. Despite the best efforts of many public agencies and private entities, disparities in wealth, technology, and information create unstable conditions among nations and within the Filipino population. Additionally, the influence of non-state actors has ever increasing domestic and global implications. Nations, non-state actors, and transnational entities compete in the diplomatic, informational, military and economic arenas of the strategic environment. Rarely are only two sides involved in modern conflicts. More often, one multinational group or domestic group opposes another similar group with conflicting interests. Even within alliances or coalitions, the different parties have their own purposes.

0240. Multiple threats to Filipino interests exist. Some are direct, such as a cross-border infringement; others are indirect, such as coercion. Some regional powers aspire to dominate their neighbors and have the conventional force capabilities required to do so. Such situations may threaten Filipino vital interests, its allies, regional stability or domestic peace and order. Transnational groups conduct a range of activities that threaten Filipino interests. Such activities include terrorism, illegal drug trading, illicit arms and strategic material trafficking, international organized crime, piracy, and deliberate environmental damage. Additionally, extremism, ethnic disputes, religious rivalries, and human disasters contribute to huge refugee migrations. These further the threat to the environment and a region's or domestic stability. Collectively, these transnational threats may adversely affect Filipino interests and would definitely require military involvement.

0241. In the foreseeable future, most nations will modernize and maintain military capabilities for countering regional threats or seeking opportunities. Military change will incorporate advances in information technology, ballistic and cruise missile capabilities, WMD, and genetic engineering. Potential threats vary from heavy conventional units to adaptive, asymmetric forces structured for local and regional use. Adversaries will seek and obtain technologies in information technology, navigation, night vision systems, and precision targeting and strike capabilities. The proliferation of WMD and long-range delivery systems will enable adversaries to threaten Filipino forces at greater ranges with increased lethality and precision.

0242. Adversaries, both foreign and domestic, are assumed to have developed warfighting doctrine that takes perceived Filipino strengths and vulnerabilities into account. They will, however, factor in allied support to Filipino forces. They will try to prevent allied forces projection and adapt to more nonlinear, simultaneous operations conducted throughout the archipelago. They will use conventional and unconventional means to destroy Filipino national will and the capability to wage war. It is for this reason that Philippine Army forces have continuously updated its warfighting doctrine in concert with allied troops, in a multinational force setting.

0243. Adversaries will also seek to shape conditions to their advantage. They will try to change the nature of the conflict or use capabilities that they believe will be difficult for a Filipino and other allied nations coalition to counter. They will use complex terrain, urban environments, and force dispersal methods-similar to those used by the North Vietnamese, Iraqis and Serbs-to offset military advantages.

0244. Adversaries will continue to seek every opportunity for advantage over Army forces. When countered, they will adapt to the changing conditions and pursue all

available options to avoid destruction or defeat. This environment and the wide array of threats present significant challenges. Army forces must simultaneously defeat an adversary while protecting non-combatants and the infrastructure on which they depend on.

The Political Dimension

0245. The national security strategy supposedly defines how the Philippine government meets challenges in the complex and dynamic global and domestic environment. It establishes broad strategic guidance for advancing national interests through the instruments of national power. The detailed formulation of national strategic policy and direction and national military strategy is beyond the scope of this manual. Nevertheless, the national military strategy, derived from national defense strategy and the national security strategy, forms the basis for all operations in war and other uses of military forces.

0246. The military component of the national security strategy and national defense strategy focuses on using military force as an instrument of national power. The NCA combine it with other instruments of national power to preserve, protect, and advance national interests. Military operations influence, and are influenced by, political direction and the integrated use of other instruments of power. The military objective in war is rapid, decisive victory. The NCA determine how that victory contributes to the overall policy objectives. War makes the most overt use of military force. However, successful military operations in any form require Army force commanders with a clear sense of strategic policy goals and objectives. They must understand how using military force fits into the national security strategy and the desired military conditions required in meeting policy objectives. In addition, commanders must be able to clearly and concisely articulate this understanding to the local and international media. All political decisions made during operations have strategic, operational, and tactical implications. Likewise, each strategic, operational, and tactical action directly or indirectly affects the political dimension. Translating political decisions into military missions depends on informed and candid assessments. Army force commanders must articulate the military capabilities and limitations of their forces to the UC, and when required, directly to the NCA.

0247. The different operational environments also evoke different issues at the national and local civil governance levels. By experience, not all the political elements of the Philippine government are always aligned with the Army. In no so few cases, they are sometimes the hindrance to the attainment of military objectives. Army commanders must be cognizant about this and must be able to integrate into their concept of operations how they will encourage synergy and a healthy working environment with the other agencies.

The Unified Action Dimension

0248. A national military strategy calls for Army forces to act as part of a fully interoperable and integrated joint force. Consequently, the employment of Army

forces in campaigns and major operations is viewed from a joint and inter-agency perspective. UCs synchronize Army force operations with those of other service forces and other civilian armed forces such as the National Police and Coast Guard. They exploit Army force capabilities and create an effective joint team.

0249. Land operations determine the outcome of general wars and major military operations. Army forces are the decisive forces for sustained land combat, war termination, and post-war stability. UCs normally designate the land component as the supported force during those phases of a campaign. In other phases, they may designate another component as the supported force. In such cases, Army forces support the lead component. During all campaign phases, UCs synchronize the complementary capabilities of the service components that comprise the joint force. In all cases, UCs have access to the full complement of versatile Army forces to achieve strategic and operational objectives.

0250. Army forces also work with multinational, multi-sectoral or interagency partners to accomplish their missions. Ideally, multinational, multi-sectoral and interagency partners provide cultures, perspectives, and capabilities that reinforce and complement Army strengths and capabilities. Close coordination is the foundation of successful unified action.

The Land Operation Dimension

0251. Land operations continue to be the salient feature of conflict. It usually involves destroying or defeating enemy forces or taking land objectives that reduce the enemy's effectiveness or will to fight. Four characteristics distinguish land operations:

a. **Scope**. Land operations involve contact with an enemy throughout the depth of an operational area. Forces conduct simultaneous and sequential operations in contiguous and noncontiguous areas of operations (AOs). Commanders maneuver forces to seize and retain key and decisive terrain. They use maneuver, fires, and other elements of Army power to defeat or destroy enemy forces. Land operations normally entail close and continuous contact with non-combatants. Rules of engagement reflect this.

b. **Duration**. Land operations are repetitive and continuous. It involves rendering an enemy incapable or unwilling to conduct further action. It may require destroying him.

c. **Terrain**. Land operations take place within a complex variety of natural and manmade features. The complexity of the ground environment contrasts significantly with the relative transparency of air, sea, and space. Plans for land operations must account for the visibility and clutter of the terrain and the effects of weather and climate.

d. **Permanence**. Land operations frequently require seizing or securing ground. With control of the ground comes control of populations and productive

capacity. Thus, land operations make permanent the temporary effects of other operations.

The Information Dimension

0252. All military operations take place within an information environment that is largely outside the control of military forces. The information environment is the aggregate of individuals, organizations, and systems that collect, process, store, display, and disseminate information; also included is the information itself. National, international, and non-state actors use this environment to collect, process, and disseminate information. The media's use of real-time technology affects public opinion, both in the country and abroad, and alters the conduct and perceived legitimacy of military operations

0253. Historically, information superiority has enabled decisive Army force operations. Information superiority enables Army forces to see first, understand the situation more quickly and accurately, and act faster than their adversaries. Derived from the effective synchronization of intelligence, surveillance and reconnaissance (ISR), information management (IM), and information operations (IO), information superiority is an operational advantage that results in friendly forces gaining and retaining the initiative. Effective ISR operations and IM identify the information commanders require, collect it, and get it to them when they need it. Offensive IO degrades an adversary's will to resist and ability to fight while simultaneously denying him relevant friendly force information. Defensive IO protects friendly information and C2 systems. Information superiority means commanders receive accurate, timely information that enables them to make better decisions and act faster than their adversaries. Early attainment of information superiority influences all aspects of Army force operations. For example, sharing accurate, current information between forces creates the conditions for mission accomplishment. Sharing real-time changes in the situation among all elements of a force in contact facilitates synchronization and encourages subordinates to exercise initiative.

The Technology Dimension

0254. Technology enhances leader, unit, and soldier performance and affects how Army forces conduct (plan, prepare, execute, and continuously assess) full spectrum operations in peace, conflict, and war. For example, commanders and staffs assess capability differences among Army forces along with those of joint forces when designing plans, preparing forces, and weighing employment options. Quality information provided by advanced communications and ISR capabilities assist commanders in making decisions. Battle command benefits from the ability of modern microprocessors and telecommunications to collect, process, store, display, and disseminate information faster and with greater precision. Technology improves soldier endurance and protection, thereby increasing the potential for mission accomplishment. Army warfighting methods adopt expanded capabilities in lethal and nonlethal weapons, projectiles, propellants, and power sources. Battlefield lethality

increases due to changes in target acquisition, armament, and delivery means. Commanders leverage technological advancement in force protection and discriminate use of force in stability operations. They use improved C2, mobility, and SS in support operations. Enhanced SS, C2, and IM increase operational endurance.

0255. In any operation, Army forces assume that adversaries possess at least some advanced weaponry. Their weaponry may range from a computer connected to the Internet to WMD. Adversaries may also possess information-based technologies or capabilities, such as satellite imagery, night vision devices, or precision-delivery systems. These can present asymmetric threats to Army forces. The potential for asymmetric threats puts a premium on intelligence preparation of the operational environment (IPOE) and the other intelligence tasks, to include situation development and providing indications and warning. Operational success requires identifying enemy capabilities (strengths and vulnerabilities), intentions, and courses of action.

0256. Fielding technologically advanced systems means that commanders will have to combine the capabilities of units at different modernization levels. For example, digitized forces have advantages - such as precision location, precision fires, and in-transit visibility of equipment, personnel, and stocks - that other forces do not. Digitized forces use fires and maneuver with a precision and tempo that less modernized forces cannot match. Force tailoring creates hybrid forces with dissimilar capabilities and technologies. Additional challenges arise during multinational operations. Technological, organizational, and doctrinal differences require exchanging liaison teams and C2, communications, and intelligence equipment. Integrating Army and multinational forces in a way that synchronizes and maximizes their various capabilities is one aspect of unified action.

0257. The Philippines is still far from achieving an edge on technology. Just as Philippine Army forces exploit current technology to achieve an operational advantage, so might an enemy force. Never in history has access to advanced technology been so widespread. Even adversaries lacking a research and development capability can purchase remarkably sophisticated systems in the global marketplace. In the domestic setting, improvised weapons have the same lethality and effect as with complex and expensive systems. Commanders and staffs should prepare for adversaries who use technology in very sophisticated and ingenious ways.

0258. Even with its advantages, the side with superior technology does not always win in land operations; rather, the side that applies combat power more skillfully usually prevails. The skill of soldiers, coupled with the effectiveness of leaders, decides the outcomes of engagements, battles, and campaigns. This fact does not lessen the positive effects of advanced technologies. It does, however, challenge soldiers and leaders to realize and use the potential of advanced technologies in the conduct of full spectrum operations.

Army Operational Platforms

0259. Philippine Army forces operate as part of a joint force, and in some cases, within a multinational and interagency environment. Unified action describes the

wide scope of actions (including the synchronization of activities with governmental and non-governmental agencies) taking place within unified commands. Under unified action, commanders integrate joint, single-service, special, and supporting operations with interagency, non-governmental, and multinational - to include United Nations (UN) operations.

0260. Unified action links subordinates to the unified commander under operational command authority (OPCOM). Multinational, interagency, and non-military forces work with the unified commander through cooperation and coordination. Regardless of the task or the nature of the threat, combatant commanders employ air, land, sea, space, and special operations forces, and coordinate with multinational and interagency partners, to achieve strategic and operational objectives. They formulate strategies and campaigns, organize joint forces, designate operational areas, and provide strategic guidance and operational focus to subordinates. The aim is to achieve unity of effort among many diverse agencies in a complex environment. Subordinate joint force commanders synchronize joint operations in time and space, direct the action of other military and armed forces, to include foreign armed forces in multinational operations, and coordinate with governmental and non-governmental organizations (interagency coordination) to achieve the same goal.

0261. In unified action, Army forces synchronize their actions with those of other participants to achieve unity of effort and accomplish the combatant commander's objectives. The capabilities of joint, multinational, and interagency partners can expand strengths, compensate for limitations, and provide operational and tactical depth to Army forces.

Multinational or Combined Operations

0262. Although the Philippines most of the time acts unilaterally, it pursues its national interests through alliances and coalitions when possible. These alliances and coalitions are formed along diplomatic and political channels designed to achieve strategic objectives in response to regional threats or crises. Forming alliances and coalitions increase the size of the overall force, share the cost of waging the campaign or operation, and enhance the legitimacy of the strategic aims.

0263. Multinational or combined operations are conducted within the structure of an alliance or a coalition. Military alliances, such as the Mutual Defense treaty with the United States of America and UN peacekeeping missions, may afford the participating nations time to establish formal, standard agreements for broad, long-term objectives. Alliance members strive to field compatible military systems, establish common procedures, and develop contingency plans to meet potential threats in a fully integrated manner.

0264. As defined, an alliance is the result of formal agreements (i.e., treaties) between two or more nations for broad, long-term objectives which further the common interests of the members. On the other hand, a coalition is an ad hoc arrangement between two or more nations for common action.

0265. Nations usually form coalitions for focused, short-term purposes. Often, coalition operations are conducted under the authority of a UN resolution. In successful coalitions, all parties agree to the commitment of forces, even if the resources each invests are different. While each nation has its own agenda, each brings value to the coalition, even if solely by contributing to the legitimacy of the enterprise.

0266. An Army force commander designated as a multinational or combined force commander faces many complex demands. These may include dealing with cultural issues, interoperability challenges, and an immature C2 organization. Commanders may also be required to address different national procedures, the sharing of intelligence, and support functions. Since coalition operations are not structured around standing agreements, a preliminary understanding of the requirements for operating with a specific foreign military may occur through peacetime military engagement. These developmental activities include, but are not limited to, ongoing personal contacts, pre-positioning of equipment, exercises, exchange programs, and humanitarian assistance. Every multinational or combined operation is different. Commanders analyze the mission's peculiar requirements so they can exploit the advantages and compensate for the limitations of a multinational force.

0267. Unity of command is unlikely in multinational or combined operations. The level of command authority vested in a multinational force commander is established by an agreement among the multinational partners. Most nations retain command authority over their forces. However, in certain circumstances, it may be prudent or advantageous to place Philippine Army forces under operational control (OPCON) of a foreign commander.

0268. To compensate for limited unity of command, commanders concentrate on achieving unity of effort. Consensus building, rather than direct command authority, is often the key element of successful multinational operations. Political and military policies of multinational partners can limit options for the organization of a multinational command. Long-standing alliances have integrated command structures with designated nations providing force commanders. Staffs are integrated, and senior representatives from member nations often lead subordinate allied commands. Coalition command is more challenging because it involves combining forces with no standing C2 arrangements. Command relationships and C2 structures usually evolve as the coalition develops. Multinational or combined C2 structures are usually one of three types: parallel command, lead nation command, or a combination of the two.

0269. A Parallel Command exists when nations retain control of their deployed forces. It is the simplest to establish and may be the only arrangement that satisfies national sensitivities. However parallel command may weaken unity of effort and should be avoided if possible. Under parallel command, multinational forces are directed through existing national chains of command. Decisions are made through a coordinated effort of the political and senior military leadership of member nations and forces. The coalition leadership must develop a means for coordination among the participants to attain unity of effort. Because of the absence of a single commander, the use of a parallel command structure should be avoided if possible.

0270. A Lead Nation Command exists when the nation providing most of the forces and resources provides the multinational force commander. The lead nation can retain its own C2 structure and employ other national forces as subordinate formations. Commanders may combine other nations' staffs to better coordinate complementary capabilities. More commonly, limited integration of national staffs characterizes lead nation command. Lead nation and parallel command structures can exist simultaneously within a multinational force. This occurs when two or more nations serve as controlling elements for a mix of international forces.

0271. The creation of an effective multinational or combined staff requires experience, imagination, and cultural sensitivity. There is always a temptation to push multinational participants into secondary positions and do things according to the dominant Army doctrine or habit. Long-term friction and potentially catastrophic misunderstandings usually cancel out the short-term gain in productivity these actions produce. Multinational or combined commanders carefully tailor the staff to balance coalition officers, and take particular care to accord coalition officers the same access and influence as their countrymen.

0272. During multinational or combined operations, Philippine forces establish liaison with assigned multinational forces early. Additional specialized liaison personnel in fields such as aviation, fire support, engineer, intelligence, public affairs, and civil affairs are also exchanged based on mission requirements. This integration fosters common understanding of missions and tactics, facilitates transfer of information, and enhances mutual trust and confidence.

0273. Commanders have to accommodate differences in operational and tactical capabilities among multinational forces. For example, not all armies have the staff structures or means to process, reproduce, or rapidly disseminate plans and orders. Decision authority delegated to staffs and subordinate commanders also varies among armies.

0274. The commander's intent and concept of operations must be clearly and simply articulated to avoid confusion resulting from differences in doctrine and terminology. All elements of the force must fully understand and strictly adhere to them. Detailed war-gaming, planning, and rehearsals help develop a common understanding of the operation plan and control measures.

Joint Operations

0275. Joint operations involve forces of two or more services under a single commander. Land operations and joint operations are mutually enabling - land operations are inherently joint operations. Joint integration allows UCs to attack an opponent throughout the depth of their AO, seize the initiative, maintain momentum, and exploit success. Effective joint integration does not require joint commands at all echelons, but does require understanding joint synergy at all levels of command. Joint synergy extends the concept of combined arms synergy familiar to Army soldiers. The strengths of each service component combine to overcome the limitations or reinforce the effects of the other components. The combination of multiple and

diverse joint force capabilities creates military power more potent than the sum of its parts.

0276. UCs often establish supported and supporting relationships among components. They may change these relationships between phases of the campaign or major operation or between tasks within phases. Each subordinate element of the joint force can support or be supported by other elements. For example, the Navy component commander is normally the supported commander for sea control operations; the Air Force component commander is normally the supported commander for counter-air operations. Army forces may be the supporting force during certain phases of the campaign and become the supported force in other phases.

Combined Arms

0277. The fundamental basis for the organization and operations of Army forces is combined arms. Combined arms is the synchronized or simultaneous application of several Army-specific arms such as infantry, armor, field artillery, engineers, and aviation to achieve an effect on the enemy that is greater than if each arm was used against the enemy separately or in sequence. The ultimate goal of Army organization for operations remains to be success in joint and combined arms warfare. Its combined arms capability allows commanders to form Army maneuver, operational support, and sustainment support units into cohesive teams focused on common goals.

Employing Army Forces in Joint Operations

0278. Joint doctrine describes the employment of PA forces in joint operations. Army force commanders are always either subordinate to or designated as a JFC. Understanding the command and control (C2) relationships among the components of a joint force is the key to effective joint operations.

0279. The Chief of Staff, AFP (CSAFP) can place specific commands or units under the operational command or control (OPCOM or OPCON) and/or the tactical command or control (TACOM or TACON) of a unified command for deliberate planning. In addition to forces assigned in peacetime, Army forces are *allocated* to unified commanders in response to crises.

Basic AFP Organizational Concepts

0280. The AFP adheres to the following generally defined organizational concepts for military units:

a. **Unified Command** - is a command with a broad continuing mission, of extended duration, covering a specific geographical area of operations. It is

composed of significant forces of two or more major service components, under a single commander vested with commensurate authority that is responsible for carrying out assigned missions and tasks. A unified command is established when there exists the need for the unity of effort.

b. **Assigned Units** - are units placed in an organization wherein such organization automatically assumes control of the primary functions and administration of the unit.

c. **Attached Units** - are units or personnel temporarily placed in an organization for a specific purpose, subject to the limitations imposed by the attachment order. The commander of the formation, unit or organization receiving the attachment will exercise the same degree of command and control as he does over units and persons organic to his command. However, the responsibility for transfer and promotion of personnel will normally be retained by the parent formation, unit or organization.

d.**Organic Units** - are units that are essential components of a military organization or an element in the unit's Table of Organization (TOE).

AFP Command Relationships

0281. The AFP adheres to the following defined organizational relationships between combatant commands and units (See Figure 2.3):

a. **Operational Command (OPCOM)** - is the authority granted to a commander to assign missions or tasks to subordinate commanders, to deploy units, to reassign forces and to retain or delegate operational and/or tactical control as might be deemed necessary. It does not of itself include responsibility for administration or logistics. It may also be used to denote the forces assigned to a commander. This means that when subordinate units are under operational command, commanders may assign them missions and tasks, deploy units, reassign forces, assign separate employment of components and direct forces for its inherent mission/task.

b. **Operational Control (OPCON)** - is the *transferable* command authority that may be exercised by commanders at any echelon at or below the level of combatant command. Operational control is inherent in a combatant command. Operational control may be delegated and is the authority to perform those functions of command over subordinate forces involving organizing and employing commands and forces, assigning tasks, designating objectives and giving authoritative direction necessary to accomplish a mission. Operational control includes authoritative direction over all aspects of military operations and joint training necessary to accomplish missions assigned to the command. Operational control should be exercised through the commanders of subordinate organizations. Normally this authority is exercised thorough subordinate joint force commanders and service and/or functional component commanders. Operational control normally provides full authority

to organize commands and forces and to employ those forces, as the commander in operational control considers necessary to accomplish assigned missions. Operational control does not, in itself, include authoritative direction for logistics or matters of administration, discipline, internal organization, or unit training. In essence, when subordinate units are under operational control, commanders may assign missions and tasks, deploy units, and direct forces for its inherent mission/task. However, commanders cannot reassign forces and assign separate employment of components.

c. **Tactical Command (TACOM)** - is the authority delegated to a commander to assign tasks to forces under his command for the accomplishment of the mission assigned by higher authority. Meaning, when subordinate units are under tactical command, commanders may assign tasks, deploy units, and direct forces for its inherent mission/task. However, commanders cannot alter its mission, reassign forces and assign separate employment of components.

d. **Tactical Control (TACON)** - is the command authority over assigned or attached forces or commands, or military capability or forces made available for tasking, that is limited to the detailed and, usually, local direction and control of movements or maneuvers necessary to accomplish missions or tasks assigned. Tactical control is inherent in operational control. When subordinate units are under tactical control, commanders may deploy units and direct forces for its inherent mission/task. However, commanders cannot assign missions and tasks, reassign forces and assign separate employment of components.

e. **Administrative Control (ADCON)** - is the direction or exercise of authority over subordinate or other organizations with respect to administration and support, as maybe specified by the delegating authority. ADCON may be delegated to and exercised by commands of major services forces at any echelon at or below the level of service component command.

	AFP COMMAND RELATIONSHIPS			
	OPCOM	**OPCON**	**TACOM**	**TACON**
Assign Mission	YES	YES	NO	NO
Assign Tasks	YES	YES	YES	NO
Direct Force for its assigned Mission/Task	YES	YES	YES	NO
Deploy Units	YES	YES	YES	YES (local direction)
Reassign Forces	YES	NO	NO	NO
Assign separate employment of components	YES	NO	NO	NO
Admin Responsibility	If Specified	If Specified	If Specified	If Specified

Figure 2.3 - AFP Command Relationships

AFP Support Relationships

0282. Support Relationships guide the action of a combat support or combat service support unit that aids, protects, complements, or sustains another unit. A supporting unit remains under the command of its parent headquarters. However, the supporting unit is authorized and required, within the context of the directive establishing the relationship, to respond directly to the supported unit's request for support.

0283. A support relationship is established by the assignment of a tactical mission to the supporting unit. Support relationships are further categorized as general support, direct support, reinforcing and general support reinforcing.

a. **General Support (GS) -** to provide support to the total force and not to a particular subdivision. A subdivision cannot directly request support from a GS unit. Only supported force HQs determines the priorities and assigns the mission or task. It has no command relationship with the supported unit or force.

b. **Direct Support (DS)** – to provide support to a specific unit or force. The supporting unit takes support requests directly from the supported unit or force and provides advice to the supported unit as to the use of the former's capabilities. The unit in direct support has no command relationship with the supported unit or force.

c. **Reinforcing (R) -** to provide support to a similar supporting unit. The reinforcing unit has no command relationship with the supported unit.

d. **General Support Reinforcing (GSR)**– it is a supporting unit that provides support to a total force primarily and provides reinforcing support to a similar supporting unit secondarily. It has no command relationship with the supported units or forces.

The Levels of Army Operations

"The objectives of leadership is the same at all levels but the purpose of leadership varies, i.e. at the tactical, you kill the enemy, climb the mountain or cross the river; at the operational, you make the system right, motivate people and be concerned with the people's training, health, family, and the unit's cohesion; while at the strategic, the focus is on the nation and the national interest"

Military Leadership in Challenging Times

0284. The levels of Army Operations are doctrinal perspectives that clarify the links between strategic objectives and tactical actions. Although there are no finite limits or boundaries between them, the three levels are strategic, operational and tactical. Understanding the interdependent relationship of all three helps commanders visualize a logical flow of operations, allocate resources, and assign tasks. Actions

within the three levels are not associated with a particular command level, unit size, equipment type, or force or component type. Instead, actions are defined as strategic, operational, or tactical based on their effect or contribution to achieving strategic, operational, or tactical objectives.

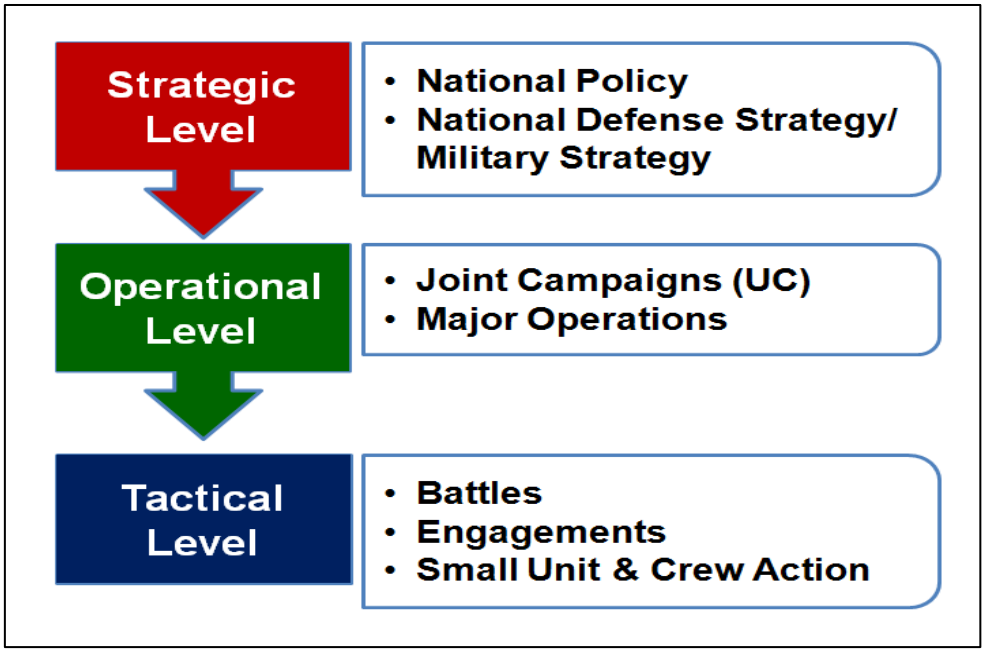

Figure 2.4 - The Levels of Army Operations.

The Strategic Level

0285. The strategic level is that level at which a nation, often as one of a group of nations, determines national and multinational security objectives and guidance and develops and uses national resources to accomplish them.

0286. Multinational or National Military Strategy is the art and science of developing and employing armed forces and other instruments of national power in a synchronized fashion to secure national or multinational objectives.

0287. The National Command Authorities (NCA) translates policy into national strategic military objectives. These national strategic objectives facilitate strategic planning. Military strategy, derived from policy, is the basis for all operations.

The Operational Level

0288. The operational level of Army Operations is the level at which campaigns and major operations are conducted and sustained to accomplish strategic objectives within areas of operations (AOs). It links the tactical employment of forces to strategic objectives. The focus at this level is on operational art - the use of military

forces to achieve strategic goals through the design, organization, integration, and conduct of strategies, campaigns, major operations, and battles.

a. A campaign is a related series of military operations aimed at accomplishing a strategic or operational objective within a given time and space.

b. A major operation is a series of tactical actions (battles, engagements, strikes) conducted by various combat forces of a single or several services, coordinated in time and place, to accomplish operational, and sometimes strategic objectives in an operational area.

0289. These actions are conducted simultaneously or sequentially under a common plan and are controlled by a single commander. Operational art determines when, where, and for what purpose major forces are employed to influence the enemy disposition before combat. It governs the deployment of those forces, their commitment to or withdrawal from battle, and the arrangement of battles and major operations to achieve operational and strategic objectives.

0290. Operational art helps commanders use resources efficiently and effectively to achieve strategic objectives. It includes employing military forces and arranging their efforts in time, space, and purpose. Operational art helps commanders understand the conditions for victory before seeking battle. It provides a framework to assist commanders in ordering their thoughts when designing campaigns and major operations. Without operational art, war would be a set of disconnected engagements with relative attrition the only measure of success. Operational art requires commanders who can visualize, anticipate, create, and seize opportunities. It is practiced not only by JFCs, but also by their senior staff officers and subordinate commanders.

0291. Operations usually imply broader dimensions of time and space than tactics; the strategic orientation at the operational level requires commanders to look beyond the immediate situation. While tactical commanders fight the current battle, operational commanders look deeper in time, space, and events. They seek to shape the possibilities of upcoming events in advance to create the most favorable conditions possible for subordinate commanders, whose tactical activities execute the campaign. Likewise, operational commanders anticipate the results of battles and engagements, and prepare to exploit them to obtain the greatest strategic advantage.

02100. Operational commanders continually communicate with their strategic superiors to obtain direction and ensure common understanding of events. Mutual confidence and communications among commanders and staffs allow the flexibility to adapt to tactical circumstances as they develop. Tactical results influence the conduct of campaigns through a complex interaction of operational and tactical dynamics. Operational commanders create the conditions for the conduct of battles and engagements, while the results of battles and engagements shape the conduct of the campaign. In this regard, commanders exploit tactical victories to gain strategic advantage, or even to reverse the strategic effect of tactical losses.

02101. Operational art is translated into operation plans through operational design. A well-designed plan and successfully executed operation shape the situation for tactical

actions. Executed skillfully, a good plan increases the chances of tactical success. It does this by creating advantages for friendly forces and disadvantages for the enemy. A flexible plan gives tactical commanders freedom to seize opportunities or react effectively to unforeseen enemy actions and capabilities. Flexible execution maintains the operational initiative and maximizes tactical opportunities.

02102. Without tactical success, a campaign cannot achieve its operational goals. An essential element of operational art, therefore, is the ability to recognize what is possible at the tactical level and design a plan that maximizes chances for the success in battles and engagements that ultimately produces the desired operational end state. Without a coherent operational design to link tactical successes, battles and engagements waste precious resources on fights that do not lead to operational goals. A thorough understanding of what is possible tactically, and the ability to create conditions that increase the chances of tactical success, are important attributes of an operational commander. Tactical commanders must understand the operational context within which battles and engagements are fought as well. This understanding allows them to seize opportunities (both foreseen and unforeseen) that contribute to achieving operational goals or defeating enemy initiatives that threaten those goals. Operational commanders require experience at both the operational and tactical levels. From this experience, they gain the instincts and intuition, as well as the knowledge, which underlie an understanding of the interrelation of tactical and operational possibilities and needs.

02103. Among many considerations, operational art requires commanders to answer the following questions:

a. What military (or related political and social) conditions must be produced in the operational area to achieve the strategic goal (ends)?

b. What sequence of actions is most likely to produce that condition (ways)?

c. How should resources be applied to accomplish that sequence of actions (means)?

d. What are the likely costs or risks in performing that sequence of actions (risk management)?

The Tactical Level

02104. Tactics is the employment of units in combat. It includes the ordered arrangement and maneuver of units in relation to each other, the terrain, and the enemy to translate potential combat power into victorious battles and engagements.

02105. A battle consists of a set of related engagements that last longer and involve larger forces than an engagement. Battles can affect the course of a campaign or major operation. On the other hand, an engagement is a small tactical conflict between opposing maneuver forces, usually conducted at brigade level and below. Engagements are usually short - minutes, hours, or a day.

02106. Tactics is also the realm of close combat, where friendly forces are in immediate contact and use direct and indirect fires to defeat or destroy enemy forces and to seize or retain ground. Exposure to close combat separates Army forces from most of their counterparts. Army forces fight until the purpose of the operation is accomplished. Because of this, they are organized to endure losses, provided with sustainment support (SS) to generate and sustain combat power, and trained to deal with uncertainty.

02107. The operational level headquarters sets the terms of battle and provides resources for tactical operations. Tactical success is measured by the contribution of an action to the achievement of operationally significant results. Battles and engagements that do not contribute to the campaign objectives, directly or indirectly, are avoided.

02108. Tactics also refer to actions by small Army units in a specified area of operations that are not necessarily combat in nature. This includes the use of non-lethal weapons and effects especially in the presence of civilians. They also invariably contribute to the success of combat operations employing lethal weapons and effects.

Chapter III
The Fundamentals of Full Spectrum Operations (FSO)

"The Armed Forces of the Philippines is a distinguished institution with an enduring legacy of defending the Filipino nation; and the ideals of peace, freedom, and democracy that our nation represents. From the Revolutionary Army led by Andres Bonifacio that won our independence, to the AFP that freed our country and helped restore democracy, our proud legacy has always been that of honor, service, and patriotism in fulfillment of our constitutional mandate."

Gen Emmanuel T Bautista

The Operational Concept

0301. The Philippine Army's operational concept is the core of its doctrine. It must be uniformly known and understood throughout the service. The operational concept frames how Army forces, operating independently as a combined arms force or as part of a joint force, conduct operations. It describes how Army forces adapt to meet the distinct requirements of ground operations. The concept is broad enough to describe operations now and in the near future. It is flexible enough to apply in any situation.

0302. The Army's operational concept is **FULL SPECTRUM OPERATIONS**. Army forces combine offensive, defensive, and support to civil governance operations simultaneously and normally as an independent force or as part of an interdependent joint force to seize, retain, and exploit the initiative, accepting prudent risk, in order to create opportunities and achieve decisive results. They employ synchronized action - lethal and nonlethal - proportional to the mission and informed by a thorough understanding of all variables of the operational environment. Mission command that conveys intent and an appreciation of all aspects of the situation, guides the adaptive use of Army forces.

0303. Full spectrum operations require continuous, simultaneous combinations of offensive, defensive, and support to civil governance tasks. In all operations, commanders seek to seize, retain, and exploit the initiative while synchronizing their actions to achieve the best effects possible. Army forces operate using mutually supporting lethal and nonlethal capabilities.

0304. Army forces use offensive and defensive operations to defeat the hostile force on land. They simultaneously execute support to civil governance operations to interact with the populace and civil authorities.

0305. Full spectrum operations begin with the commander's concept of operations. This single, unifying idea provides direction for the entire operation. Based on a specific idea of how to accomplish the mission, the concept of operations is refined during planning. Commanders adjust it throughout the operation as subordinates

develop the situation or conditions change. Often, subordinates acting on the higher commander's intent, develop the situation in ways that exploit unforeseen opportunities. Mission command is therefore an essential complement to full spectrum operations.

0306. Operations today require versatile, well-trained units, and tough, adaptive commanders. There is no set formula for applying Army power. Each campaign and major operation requires an original design and flexible execution. Army forces must be able to operate as part of a joint or multinational force anywhere on the spectrum of conflict. Varying combinations of the elements of full spectrum operations appropriate to the situation are necessary as well. The concept of operations combines and weights these elements as the situation requires.

0307. Full spectrum operations involve continuous interaction between friendly forces and multiple groups in the operational area. In addition to enemy forces and the local populace, soldiers deal with multi-sectoral partners, adversaries, civil authorities, business leaders, and other civilian agencies. This interaction is simple in concept but complex in application. Civil authorities range from strategic-level leaders to local government officials to religious leaders. Populations may include people of differing tribes, ethnic groups, and commonalities.

0308. The operational concept addresses more than combat between armed opponents. Army forces conduct operations in the midst of populations. This requires Army forces to defeat the hostile force and simultaneously shape civil conditions. Offensive and defensive tasks defeat hostile forces; support to civil governance tasks shape civil conditions. Winning battles and engagements is important, but alone, may not be decisive. Shaping civil conditions (in concert with civilian organizations, civil authorities, and multi-sectoral forces) is just as important to campaign success. In many joint operations, support to civil governance operations are often more important than the offense and defense.

0309. The emphasis on different elements of full spectrum operations changes with echelon, time, and location. In an operation dominated by support to civil governance operations, part of the force might be conducting simultaneous offensive and defensive tasks. In short, no single element is always more important than the others. Rather, *simultaneous combinations* of the elements, which commanders constantly adapt to conditions, are the key to successful ground operations.

0310. Managing training for full spectrum operations presents challenges for leaders at all echelons. Training for offensive and defensive tasks develops discipline, endurance, unit cohesion, and tolerance for uncertainty. It prepares soldiers and units to address the ambiguities and complexities inherent in support to civil governance operations as well. However, operational experience demonstrates that forces trained exclusively for offensive and defensive tasks are not as proficient at support to civil governance tasks as those trained specifically for the same. For maximum effectiveness, support to civil governance tasks require dedicated training, similar to training for offensive and defensive tasks. Likewise, forces involved in protracted support to civil governance operations require intensive training to regain proficiency in offensive or defensive tasks before engaging in large-scale combat operations. Effective training reflects a balance among the elements of full spectrum operations

that produces and sustains proficiency in all of them. Commanders adjust their emphasis by developing their core mission-essential task list.

0311. In order for full spectrum operations to be effective, several sub-concepts must be exercised. The key sub-concepts that underpin Full Spectrum Operations are; initiative, simultaneity and synchronization, lethal and nonlethal actions, and, mission command.

Initiative

0312. All Army operations aim to seize, retain, and exploit the initiative and achieve decisive results. Operational initiative is setting or dictating the terms of action throughout an operation. Initiative gives all operations the spirit, if not the form, of the offense. It originates in the principle of the offensive. The principle of the offensive is not just about attacking. It is about seizing, retaining, and exploiting the initiative as the surest way to achieve decisive results. It requires positive action to change both information and the situation on the ground. Risk and opportunity are intrinsic in seizing the initiative.

0313. To seize the initiative, commanders evaluate and accept prudent risks. Opportunities never last long. Unless commanders are willing to accept risk and then act, the adversary or the situation is likely to close the window of opportunity and exploit or nullify friendly inaction. Once they seize the initiative, Army forces exploit the opportunities it creates. Initiative requires constant effort to control tempo while maintaining freedom of action. The offensive mindset, with its focus on initiative, is central to the Army's operational concept and guides all leaders in the performance of their duty. It emphasizes opportunity created by action through full spectrum operations, whether offensive, defensive or support to civil governance operations.

0314. In combat operations, commanders force the hostile force to respond to friendly action. In the offense, it is about taking the fight to the hostile force and never allowing them to recover from the initial shock of the attack. In the defense, it is about preventing the hostile force from achieving success and then counterattacking to seize the initiative. The object is not just to kill hostile personnel and destroy their equipment. It is to compel them to react continuously and finally be driven into untenable positions. Retaining the initiative means pressuring hostile commanders into abandoning their preferred options, accepting too much risk, or making costly mistakes. As their mistakes occur, friendly forces seize opportunities and create new avenues for exploitation. The ultimate goal is to break the hostile forces' will through relentless pressure. More so, retaining the initiative also means anticipating the challenges that a situation may pose against the accomplishment of the mandated mission of the Army force.

0315. In support to civil governance operations, initiative is about improving civil conditions and applying Army power to prevent the situation from deteriorating. Commanders identify objectives that may be non-military but are critical to achieving the end state. Such objectives may include efforts to ensure effective governance, reconstruction projects that promote social well-being, and consistent actions to

improve public safety. All of these contribute to retaining and exploiting the initiative in these operations. An insurgent, for example, cannot allow government efforts to succeed without serious consequences and must react. As the hostile force reacts, Army forces maintain the initiative by modifying their own lethal and nonlethal actions, forcing the enemy to change plans and remain on the defensive. Army forces retain the initiative by anticipating both hostile force actions and civil and situational requirements, and by acting positively to address them. In support to civil governance operations, Army forces take action to restore normalcy. Soldiers work closely with their local civilian counterparts to remedy the conditions threatening lives, property, and domestic order. In some situations, rapid and determined action by Army forces becomes the stimulus for a demoralized civilian community to begin recovery. In every situation, commanders complement their actions with information engagement.

0316. Seizing, retaining, and exploiting the initiative depend on individual initiative - the willingness to act in the absence of orders, when existing orders no longer fit the situation, or when unforeseen opportunities or threats arise. Military history contains many instances where a subordinate's action or inaction significantly affected the tactical, operational, or even strategic situation. When the opportunity occurs, it is often fleeting. Subordinate leaders need to act quickly, even as they report the situation to their commanders. Individual initiative is the key component of mission command. Full spectrum operations depend on subordinate commanders exercising individual initiative and higher commanders giving them the authority to do so.

Simultaneity and Synchronization

0317. Simultaneously executing the elements of full spectrum operations requires the synchronized application of Army power. Synchronization is the arrangement of military actions in time, space, and purpose to produce maximum relative Army power at a decisive place and time. It is the ability to execute multiple, related and mutually supporting tasks in different locations at the same time, producing greater effects than executing each in isolation. Synchronization is a means, not an end. Commanders balance it with agility and initiative; they never surrender the initiative for the sake of synchronization. Rather, they synchronize activities to best facilitate mission accomplishment. Excessive synchronization can lead to over-control, which limits the initiative of subordinates.

0318. Simultaneity means doing multiple things at the same time. It requires the ability to conduct operations in depth and to orchestrate them so that their timing multiplies their effectiveness. Commanders consider their entire area of operations, the hostile force or threat, the information tasks necessary to shape the operational environment, and civil conditions. They then mount simultaneous operations that immobilize, suppress, or shock the hostile force or stabilize the situation. Such actions nullify the hostile force's ability to conduct synchronized, mutually supporting actions. Army forces increase the depth of their operations through combined arms, advanced information systems, and joint capabilities. Because Army forces conduct operations across large areas, the hostile force faces many potential friendly actions. Executing operations in depth is equally important in support to civil governance operations; commanders act to keep threats from operating outside the reach of

friendly forces. In some support to civil governance operations, depth includes conducting operations that reach all citizens in the area of operations, bringing relief as well as hope.

Lethal and Nonlethal Actions

0319. An inherent, complementary relationship exists between using lethal force and applying military capabilities for nonlethal purposes. Though each situation requires a different mix of violence and restraint, lethal and nonlethal actions used together complement each other and create dilemmas for opponents. Lethal actions are critical to accomplishing offensive and defensive missions. However, nonlethal actions are also important contributors to full spectrum operations, regardless of which element dominates. Finding ways to accomplish the mission with an appropriate mix of lethal and nonlethal force has become an important consideration for every commander. Commanders analyze the situation carefully to achieve a balance between lethal and nonlethal actions.

Lethal Actions

0320. Offensive and defensive operations place a premium on employing the lethal effects of Army power against the enemy. In these operations, speed, surprise, and shock are vital considerations. Historically, the side better able to combine them, defeats its opponent rapidly while incurring fewer losses. Such victories create opportunities for exploitation. In some operations, the effects of speed, surprise, and shock are enough to collapse organized resistance.

0321. Speed is swiftness of action. It allows a force to act before the enemy is ready or before the situation deteriorates further. Speed requires being able to adjust operations quickly to dynamic conditions. It increases opportunities to exploit momentary tactical advantages and expand them to retain and exploit the initiative. Wherever possible, Army forces exploit their advantages in command and control, tactical mobility, and joint capabilities to operate at a higher tempo than the hostile force. Delegating decision-making authority to subordinates through mission command allows commanders to increase the speed of decision-making and execution in most situations. Rapid friendly action may surprise the hostile force and create opportunities.

0322. Surprise is achieved by acting at a time, acting in a place, or using methods to which the hostile force cannot effectively react or does not expect. Speed contributes to surprise, so does executing operations simultaneously and in depth. Exploiting advantages gained through security, military deception, and aggressive intelligence, surveillance, and reconnaissance (ISR) operations contributes to surprise. Surprise is essential when executing offensive missions that complement support to civil governance operations (such as a raid). It mitigates the effectiveness of hostile force early warning networks within the local populace.

0323. Shock results from applying overwhelming violence. Army power applied with enough speed and magnitude to overwhelm the enemy produces it. Shock slows and

disrupts hostile force operations. It is usually transient, but while it lasts, shock may paralyze the hostile force's ability to fight. Sometimes the psychological effects of threatening to use overwhelming violence can also produce shock. Shock is often greater when generated with asymmetric means. Joint forces create opportunities to increase it by using capabilities against which the hostile force has limited defense. Surprise and speed magnify the effects of shock.

Nonlethal Actions

0324. Army forces employ a variety of nonlethal means. Support to civil governance operations often involves using military capabilities to perform such tasks as restoring essential services. Support to civil governance operations is characterized by providing constructive support to civil authorities. However, demonstrating the potential for lethal action(by actions such as increased military presence in an area) often contributes to maintaining order during support to civil governance operations. Other examples include such actions as pre-assault warnings and payments for collateral damage. Some nonlethal actions, such as information engagement, are common to all operations.

0325. Friendly and hostile forces continuously struggle for information advantages while conducting operations in the physical domains. Friendly information actions shape the operational environment by attacking the hostile force's command and control system, defending against electronic or virtual attacks, and protecting friendly information. Command and control warfare contributes to the success of offensive and defensive operations. It employs many nonlethal means to attack the hostile force's command and control capabilities. Increasingly sophisticated capabilities allow Army forces to identify, disrupt, and exploit enemy communications (including networks). These actions may keep the hostile force from massing their resisting power effectively or synchronizing combined arms or terrorist operations. Commanders may use electromagnetic means alone or with maneuver and lethal fires.

0326. Nonlethal actions in combat include a wide range of intelligence-gathering, disruptive, and other activities. Effective maneuver and fires require timely, accurate intelligence and an effective command and control system. The threat of detection often compels the hostile force to limit or cease operations. This inaction allows friendly forces to seize the initiative. Interference with hostile force command and control through nonlethal means can also limit its effectiveness and increase its exposure to attack.

0327. Support to civil governance operations emphasizes nonlethal, constructive actions by soldiers working among non-combatants. Civil affairs personnel have a major role. In support to civil governance operations, they work with and through civilian agencies and other civilian organizations to enhance the government's legitimacy. Commanders use continuous information engagement shaped by intelligence to inform, influence, and persuade the local populace within limits prescribed by law. They also integrate information engagement with support to civil governance tasks to counter false and distorted information and propaganda.

0328. Nonlethal, constructive actions can persuade the local populace to withhold support from the hostile force and provide information to friendly forces. Loss of

popular support presents the hostile force with two bad choices: stay and risk capture, or depart and risk exposure to lethal actions in less populated areas. Commanders focus on managing the local populace's expectations and countering rumors. However, they recognize that their soldiers' actions, positive and negative, are the major factors in the populace's perception of Army forces.

0329. The moral advantage provided by the presence of well-trained, well-equipped, and well-led forces can be a potent nonlethal capability. It creates fear and doubt in the minds of the hostile force and may deter adversaries. This effect is important in numerous support to civil governance-dominated operations. Even though support to civil governance operations emphasized nonlethal actions, the ability to engage potential enemies with decisive lethal force remains a sound deterrent. Hostile force commanders may curtail their activities and avoid combat if they perceive Army forces as highly capable and willing to use precise, lethal force. This permits Army forces to extend the scope and tempo of nonlethal actions.

Mission Command

0330. The Army's preferred method of exercising command and control in full spectrum operations is MISSION COMMAND. Mission commandis the conduct of military operations through centralized planning and decentralized execution based on mission orders. Successful mission command demands that subordinate leaders at all echelons exercise disciplined initiative; acting aggressively and independently to accomplish the mission, within the commander's intent.

0331. Mission command gives subordinates the greatest possible freedom of action. Commanders focus their orders on the purpose of the operation rather than on the details of how to perform assigned tasks. They delegate most decisions to subordinates. This minimizes detailed control and empowers subordinates' initiative. Mission command emphasizes timely decision-making, understanding the higher commander's intent, and clearly identifying the subordinates' tasks necessary to achieve the desired end state. It improves subordinates' ability to act effectively in fluid, chaotic situations.

0332. Mission command requires an environment of trust and mutual understanding. Respect and full familiarity with the commander's intent and concept of operations are very essential. Mission command applies to all operations across the spectrum of conflict. The elements of mission command are:

a. Commander's intent.

b. Subordinates' initiative.

c. Mission orders, which include: a brief concept of operations, minimum necessary control measures and resource allocation.

0333. Chaos and uncertainty dominate land conflict. Predictability is rare, making centralized decision-making and orderly processes ineffective. In addition,

commanders must contend with a thinking, adaptive hostile force or an unpredictable natural phenomenon. Under such conditions, leaders of forces in contact can often see and act on immediate opportunities and threats better than their superiors can. Delegating the greatest possible authority to subordinates helps the force adapt the operation to the situation quickly and retain the initiative.

0334. While mission command restrains higher level commanders from micromanaging subordinates, it does not remove them from the fight. Rather, mission command frees these commanders to focus on accomplishing their higher commander's intent and on critical decisions only they can make. Higher commanders anticipate developments, allocate resources to exploit successes, and intervene to shape the operations necessary. Mission command is ideally suited to an environment of complexity and uncertainty.

0335. Mission command tends to be decentralized, informal, and flexible. Orders and plans are as brief and simple as possible. The fundamental basis of mission command is trust and mutual understanding between superiors and subordinates, an atmosphere that the senior commander must cultivate. Mission command counters the uncertainty of war by empowering subordinates at the scene to make decisions quickly. Commanders rely on their subordinates' ability to coordinate with one another, using the human capacity to understand with minimum verbal information exchange.

0336. In any operation, the situation may change rapidly. The speed and violence of modern operations add to combat's inherent chaos and disorder. Operations the commander envisioned may bear little resemblance to actual events. Even with the most advanced information systems, higher headquarters often have difficulty understanding the situation on the ground. Perhaps most important, opportunities for exploitation or counterattack may occur suddenly. Subordinate commanders need maximum latitude to take advantage of such situations and meet the higher commander's intent when the original orders no longer apply. Full spectrum operations require leaders schooled in independent decision-making, aggressiveness, and risk taking in an environment of mission orders and mission command at every level.

0337. Mission command applies to all operations across the spectrum of conflict. Often the operational environment encountered during support to civil governance operations proves more complex than that encountered in offensive and defensive operations. The continuous, often volatile, interaction of brigades and smaller units with the local populace during support to civil governance operations requires leaders willing to exercise initiative. They must be able and willing to solve problems without constantly referring to higher headquarters.

0338. Mission command encourages commanders to act promptly, consistently, and decisively in all situations. Under mission command, commanders explain not only the tasks assigned and their immediate purpose but also the higher commander's intent. Doing this helps junior commanders and their soldiers understand what is expected of them and what constraints to apply. Most importantly, they understand the mission's purpose and context. The commander's intent also guides subordinates working with agencies not under military control.

The Elements of Full Spectrum Operations

0339. Full spectrum operations require simultaneous combinations of three elements - offense, defense, and support to civil governance operations. (See Figure 3-1).Each primary task has numerous associated subordinate tasks. When combined with who (unit), when (time), where (location), and why (purpose), the primary tasks become mission statements.

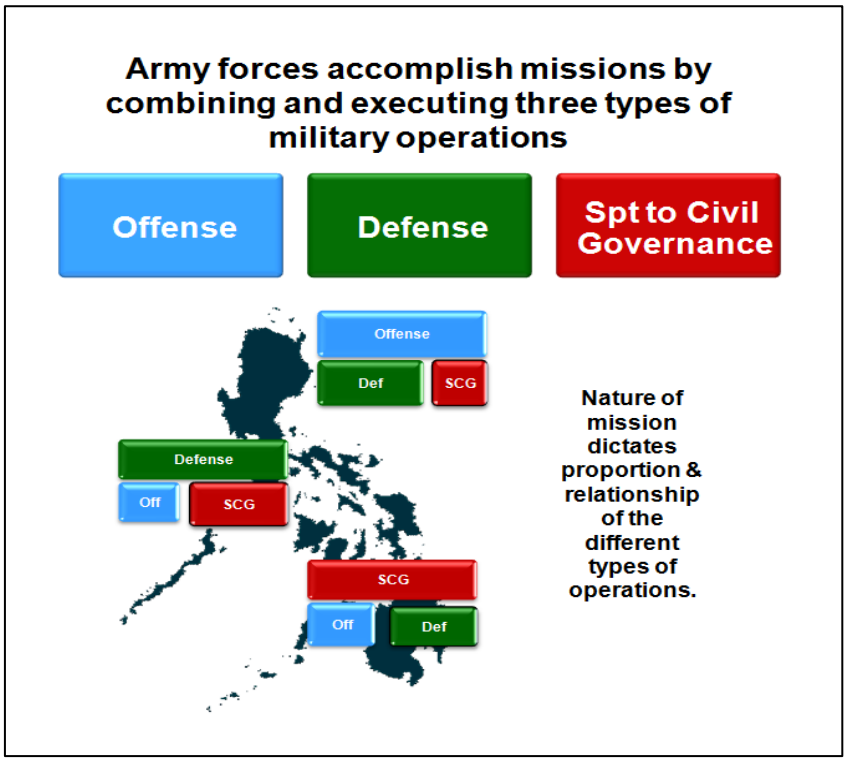

Figure 3.1 - The Elements of Full Spectrum Operations

Offensive Operations

0340. Offensive Operations are combat operations conducted to defeat and destroy enemy forces and seize terrain, resources, and population centers. They impose the commander's will on the enemy. In combat operations, the offense is the decisive element of full spectrum operations. Against a capable, adaptive enemy, the offense is the most direct and sure means of seizing, retaining, and exploiting the initiative to achieve decisive results. Executing offensive operations compels the enemy to react, creating or revealing weaknesses that the attacking force can exploit. Successful offensive operations place tremendous pressure on defenders, creating a cycle of deterioration that can lead to their disintegration.

0341. While strategic, operational, or tactical considerations may require defending, defeating an enemy at any level sooner or later requires shifting to the offense. Even

in the defense, seizing and retaining the initiative requires executing offensive operations at some point.

"Upon receiving information on the presence of a large NPA camp in the hinterlands of Murcia, Captain Arturo B Ortiz initiated a planned raid mission. Under cover of darkness, he led his troops in a grueling 11-hour cross-country foot march and dangerously scaled a 1,000 foot steep cliff to infiltrate the enemy camp. He courageously led his exhausted troops in creeping to as close as 10 meters from the enemy, cautiously avoiding booby traps and claymore mines.

As he launched the surprise attack, the stunned rebels scampered for cover and fought back from their bunkers, behind tree trunks and fallen trees in total disarray. He sustained the momentum of the attack through accurate and controlled fire and maneuver. Disregarding personal safety, he darted from one team to another to encourage his troops and closely supervised the operation. He further instructed the troops to avoid hitting the women and children. In one instance, he rushed towards a group of hysterical women and children huddled under a tree and instructed them to lie prone to avoid being hit. After a 2-hour gun battle, Captain Ortiz and his troops resoundingly defeated the enemy and completely overran the 28- hut NPA training camp."

Excerpt from the Medal of Valor Citation

0342. Effective offensive operations capitalize on accurate intelligence regarding the enemy, terrain and weather, and civil considerations. Commanders maneuver their forces to advantageous positions before making contact. However, commanders may shape conditions by deliberately making contact to develop the situation and mislead the enemy. In the offense, the decisive operation is a sudden, shattering action against an enemy weakness that capitalizes on speed, surprise, and shock. If that operation does not destroy the enemy, operations continue until enemy forces disintegrate or retreat to where they no longer pose a threat.

Primary Offensive Tasks

0343. At the operational level, offensive operations defeat enemy forces that control important areas or contest the government's authority. The joint or combined arms force conducts operations throughout its operational area. Army forces attack using maneuver to achieve objectives that conclude the campaign or move it to a subsequent phase. In campaigns and major operations, operational maneuver includes deploying land forces to positions that facilitate joint force offensive action. Operational-level offensives in counterinsurgency may be conducted to eliminate insurgent sanctuaries. Counterinsurgencies usually combine offensive and support to civil governance tasks to achieve decisive results.

0344. In offensive operations, a force often transitions from one offensive task to another without pausing. For example, an attack can lead to exploitation and then pursuit, or to exploitation followed by another attack as enemy forces rally. Army forces perform the following primary offensive tasks:

a. **Movement to Contact**. A movement to contact develops the situation and establishes or regains contact. It also creates favorable conditions for subsequent tactical actions. Forces executing this task seek to make contact

with the smallest friendly force feasible. On contact, the commander has five options: attack, defend, bypass, delay, or withdraw. Movements to contact include search and attack, and cordon and search operations.

b. **Attack**. An attack destroys or defeats enemy forces, seizes and secures terrain, or both. Attacks require maneuver supported by direct and indirect fires. They may be either decisive or shaping operations. Attacks may be hasty or deliberate, depending on the time available for planning and preparation. Commanders execute hasty attacks when the situation calls for immediate action with available forces and minimal preparation. They conduct deliberate attacks when they have more time to plan and prepare. Success depends on skillfully massing the effects of all the elements of Army power.

c. **Exploitation.** Exploitation rapidly follows a successful attack and disorganizes the enemy in depth. Exploitations seek to expand an attack to the point where enemy forces have no alternatives but to surrender or flee. Commanders of exploiting forces receive the greatest possible latitude to accomplish their missions. They act with great aggressiveness, initiative, and boldness. Exploitations may be local or major. Local exploitations take advantage of tactical opportunities, foreseen or unforeseen. Division and higher headquarters normally conduct major exploitations using mobile forces to transform tactical success into a pursuit.

d. **Pursuit**. A pursuit is designed to catch or cut off a hostile force attempting to escape with the aim of destroying it. Pursuits often follow successful exploitations. However, they can develop at any point when enemy forces are beginning to disintegrate or disengage. Pursuits occur when the enemy fails to organize a defense and attempts to disengage. If it becomes apparent that enemy resistance has broken down entirely and enemy forces are fleeing, a force can transition to a pursuit from any type of offensive or defensive operation. Pursuits require speed and decentralized control.

e. **Strike**. A strike is a fast-paced short duration offensive operation targeting a specific and confirmed military target. It is characterized by surprise and lethal firepower done normally by a small, light compact Army force of up to battalion size. Planning a strike is usually hasty but done with specific intelligence support that may include technical means and sometimes human guides that enhance precision. Whether or not a strike is successful, it is called off as soon as practicable with minimal exposure to civilian populations.

Purpose of Offensive Operations

0345. Seizing, retaining, and exploiting the initiative is the essence of the offense. Offensive operations seek to throw enemy forces off balance, overwhelm their capabilities, disrupt their defenses, and ensure their defeat or destruction by synchronizing and applying all the elements of Army power. The offensive operation ends when it destroys or defeats the enemy, reaches a limit of advance, or approaches culmination. Army forces conclude an offense in one of four ways: consolidating gains, resuming the attack, transitioning to the defense, or preparing for future operations. Army forces conduct offensive operations for the following purposes:

a. **Dislocate, Isolate, Disrupt, and Destroy Enemy Forces.** Well-executed offensive operations dislocate, isolate, disrupt, and destroy enemy forces. If destruction is not feasible, offensive operations compel enemy forces to retreat. Offensive maneuver seeks to place the enemy at a positional disadvantage. This allows friendly forces to mass overwhelming effects while defeating parts of the enemy force in detail before the enemy can escape or be reinforced. When required, friendly forces close with and destroy the enemy in close combat. Ultimately, the enemy surrenders, retreats in disorder, or is eliminated altogether.

b. **Seize Key Terrain.** Offensive maneuver may seize terrain that provides the attacker with a decisive advantage. The enemy either retreats or risks defeat or destruction. If enemy forces retreat or attempt to retake the key terrain, they are exposed to fires and further friendly maneuver.

c. **Deprive the Enemy Resources.** At the operational level, offensive operations may exact control of major population centers, seats of government, production facilities, and transportation infrastructure. Losing these resources greatly reduces the enemy's ability to resist. In some cases, Army forces secure population centers or infrastructure and prevent irregular forces from using them as a base or benefitting from the resources that they generate.

d. **Develop Intelligence.** Enemy deception, concealment, and security may prevent friendly forces from gaining necessary intelligence. Some offensive operations are conducted to develop the situation and discover the enemy's intent, disposition, and capabilities.

e. **Deceive and Divert the Enemy.** Offensive operations distract enemy intelligence, surveillance, and reconnaissance. They may cause the enemy to shift reserves away from the friendly decisive operation.

f. **Create a Secure Environment for Recovery Operations.** Support to civil governance operations cannot occur if significant enemy forces directly threaten or attack the local populace. Offensive operations destroy or isolate the enemy so recovery operations can proceed. Offensive operations against insurgents help keep them off balance. These actions may force insurgents to defend their bases, thus keeping them from attacking.

Defensive Operations

0346. Defensive operations are combat operations conducted to defeat an enemy attack, gain time, economize forces, and develop conditions favorable for offensive or support to civil governance operations. The defense alone normally cannot achieve a decision. However, it can create conditions for a counteroffensive operation that lets Army forces regain the initiative. Defensive operations can also establish a shield behind which support to civil governance operations can progress. Defensive operations counter enemy offensive operations. They defeat attacks, destroying as

much of the attacking enemy as possible. They also preserve control overland, resources, and populations. Defensive operations retain terrain, guard populations, and protect critical capabilities against enemy attacks. They can be used to gain time and economize forces so offensive tasks can be executed elsewhere.

0347. Successful defensive operations share the following characteristics: preparation, security, disruption, massed effects, and flexibility. Successful defenses are aggressive. Commanders use all available means to disrupt enemy forces. They disrupt attackers and isolate them from mutual support to defeat them in detail. Isolation includes extensive use of command and control warfare. Defenders seek to increase their freedom of maneuver while denying it to attackers. Defending commanders use every opportunity to transition to the offense, even if temporarily. As attackers' losses increase, they falter and the initiative shifts to the defenders. These situations are favorable for counterattacks. Counterattack opportunities rarely last long; defenders strike swiftly when the attackers culminate. Surprise and speed complement shock and allow counterattacking forces to seize the initiative and overwhelm the attackers.

Primary Defensive Tasks

0348. At the operational level, an enemy offensive may compel joint forces to conduct major defensive operations. Such operations may require defeating or preventing attacks or halting an insurgent movement's mobilization. Operational defenses may be executed anywhere in the operational area. The following primary tasks are associated with the defense. Defending commanders combine these tasks to fit the situation:

a. **Mobile Defense.** In a mobile defense, the defender withholds a large portion of available forces for use as a striking force in a counterattack. Mobile defenses require enough depth to let enemy forces advance into a position that exposes them to counterattack. The defense separates attacking forces from their support and disrupts the enemy's command and control. As enemy forces extend themselves in the defended area and lose momentum and organization, the defender surprises and overwhelms them with a powerful counterattack.

b. **Area Defense.** In an area defense, the defender concentrates on denying enemy forces access to designated terrain for a specific time, limiting their freedom of maneuver and channeling them into killing areas. The defender retains terrain that the attacker must control in order to advance. The enemy force is drawn into a series of kill zones where it is attacked from mutually supporting positions and destroyed, largely by fires. Most of the defending force is committed to defending positions while the rest is kept in reserve. Commanders use the reserve to preserve the integrity of the defense through reinforcement or counterattack.

c. **Retrograde.** Retrograde involves organized movement away from the enemy. This includes delays, withdrawals, and retirements. Retrograde operations gain time, preserve forces, place the enemy in unfavorable positions, or avoid combat under undesirable conditions.

Mobile and Static Elements in the Defense

0349. All three primary defensive tasks use mobile and static elements. In mobile defenses, static positions help control the depth and breadth of the enemy penetration and retain ground from which to launch counterattacks. In area defenses, commanders closely integrate mobile patrols, security forces, sensors, and reserves to cover gaps among defensive positions. In retrograde operations, some units conduct area or mobile defenses along with security operations to protect other units executing carefully controlled maneuver or movement rearward. Static elements fix, disrupt, turn, or block the attackers and gain time for other forces to pull back. Mobile elements maneuver constantly to confuse the enemy and prevent enemy exploitation.

Purposes of Defense Operations

0350. Defending forces await the enemy's attack and counter it. Waiting for the attack is not a passive activity. Commanders conduct aggressive security operations and intelligence, surveillance, and reconnaissance. Such actions locate enemy forces and deny them information. Defenders engage enemy forces with fires, spoiling attacks, and security operations to weaken them before they reach the main battle area. Commanders use combined arms and joint capabilities to attack enemy vulnerabilities and seize the initiative. Army forces conduct defensive operations for the following purposes.

a. **Deter or Defeat Enemy Offensive Operations.** The primary purpose of the defense is to deter or defeat enemy offensive operations. Successful defenses stall enemy actions and create opportunities to seize the initiative. Defensive operations may deter potential aggressors if they believe that breaking the friendly defense would be too costly.

b. **Gain Time**. Commanders may conduct a defense to gain time. Such defensive operations succeed by slowing or halting an attack while allowing friendly reserves enough time to reinforce the defense. Delaying actions trade space for time to improve defenses, expose enemy forces to joint attack, and prepare counterattacks.

c. **Achieve Economy of Force.** The defense is also used to achieve economy of force. Astute use of terrain, depth, and security operations allows friendly forces to minimize resources used defensively. This allows commanders to concentrate combat power for offensive operations.

d. **Retain Key Terrain.** The mission of many defensive operations is to retain key terrain. Such defenses are necessary to prevent enemy forces from occupying key terrain. Control of key terrain can sway the outcome of the battle or engagement depending on which side controls it. In operations dominated by support to civil governance tasks, friendly bases become key terrain.

e. **Protect the Populace, Critical Assets, and Infrastructure.** Defense of the local populace and vital assets is important to support to civil governance operations. It allows Army forces to receive greater support from the

government and the people. Army forces protect military and civilian areas that are important to success and provide indirect support to other government organizations. Achieving this purpose begins with defenses around lodgments and bases, ensuring freedom of action. This protection is very important in counterinsurgency operations where some facilities have significant economic and political value as opposed to tactical military importance.

f. **Develop Intelligence.** As with the offense, defensive operations may develop intelligence. The more successful the defense, the more Army forces learn about the enemy. A particular phase or task within a defense (for example, a covering force mission) may be conducted to satisfy commander's critical information requirements about the enemy's direction of attack and main effort.

Support to Civil Governance Operations

0351. Encompass various military missions, tasks, and activities conducted in coordination with other instruments of national power to maintain or re-establish a safe and secure environment; provide essential governmental services, emergency infrastructure reconstruction, and humanitarian relief. Support to civil governance operations can be conducted in support of a local government unit, a national government agency or foreign entities, both military and civilian, in accordance with an international accord or agreement. Support to civil governance operations involves both coercive and constructive military actions. They help to establish a safe and secure environment and facilitate the re-establishment of peace and order. Support to civil governance operations can also help establish political, legal, social, and economic institutions and support the transition to robust local governance. Support to civil governance operations must maintain the initiative by pursing objectives that resolve the causes of instability.

0352. Coordination, integration, and synchronization between stakeholders, other government agencies, and Army forces are enhanced by transparency and credibility. The degree to which these entities cooperate is fundamental. Commanders publicize their mandate and intentions. Within the limits of operational security, they make the populace aware of the military techniques applied to provide security and control. Actions on the ground, reinforced by a clear and consistent message, produce transparency. This transparency reinforces credibility. Credibility reflects the populace's assessment of whether the force can accomplish the mission and the mandated strategic objectives of such military actions. Army forces require the structure, resources, and rules of engagement appropriate to accomplishing the mission and discharging their duties swiftly and firmly. They must leave no doubt as to their capability and intentions.

0353. As a primary Army capability, Civil Affairs activities enhance the relationship between military forces, and civil authorities in areas with military forces. They involve applying civil affairs functional specialty skills to areas normally under the responsibility of the local government units, without the intention of usurping their fundamental functions. These operations involve establishing, maintaining,

influencing, or exploiting relations between military forces and all levels of local government units and agencies, to include non-governmental organizations. These activities are fundamental to executing support to civil governance tasks. Civil affairs personnel, other Army forces, other government agencies, or a combination of all three, can perform these tasks.

0354. Army units and personnel develop detailed civil considerations assessments included in the IPOE. These include information about infrastructure, civilian institutions, and the attitudes and activities of civilian leaders, populations, and organizations. These assessments may reveal that a local government unit does not exist or is incapable of performing its functions. In such cases, Army forces may support or exercise governmental authority until a credible civil authority is established.

0355. The combination of tasks conducted during support to civil governance operations depends on the situation. In some operations, the local government units can meet most or all of the population's requirements. In those cases, Army forces work with and through these authorities. Commanders use civil affairs activities to mitigate how the military presence affects the populace and vice versa. Conversely, Army forces operating in a chaotic locality may need to support the well-being of the local populace. That situation requires Army forces to work with civilian agencies to restore basic capabilities. Again, civil affairs activities are important in establishing the trust between Army forces and civilian organizations required for effective, working relationships.

0356. Support to civil governance operations may be necessary to develop local government capacities for security and control of local security forces, a viable local market economy, the rule of law, and an effective local government. Army forces develop these capabilities by working with the local government units at different levels. The goal is to stabilize the situation that can be sustained by local government assets without Army forces. Security, the health of the local economy, and the capability of self-government are related. Without security, the local economy falters. A functioning economy provides employment and reduces the dependence of the population on the government for necessities. Security and economic stability precede an effective and stable government.

0357. Support to civil governance operations requires the absence of major threats to friendly forces and the populace. As offensive operations clear areas of hostile forces, part of the force secures critical infrastructure and populated areas. Establishing civil security and essential services are implied tasks for commanders during any combat operation. Commanders should act to minimize and relieve civilian suffering. However, if a unit is decisively engaged in combat operations, it should not be diverted from its mission to perform tasks needed to aid populations.

0358. Commanders plan to minimize the effects of military presence on the populace. They promptly inform their higher headquarters of civilian requirements and conditions that require attention.

Support to Civil Governance Tasks

0359. As civil security is established, the force returns territory to local civil authorities' control when feasible. Transitions to civil authority require coordinating and integrating civilian and military efforts. Unified action is crucial. Properly focused, effectively executed special purpose tasks prevent population centers from degenerating into civil unrest and becoming recruiting areas for opposition movements or insurgencies.

a. **Counterinsurgency Operations (CIO) -** Counterinsurgency operations are military, paramilitary, political, economic, psychological, and civic actions taken by a government to defeat an organized movement aimed at the overthrow of a constituted government through the use of subversion and armed conflict. Significantly, an insurgency is an organized, protracted politico-military struggle designed to weaken the control and legitimacy of an established government, occupying power, or other political authority while increasing insurgent control.

b. **Peace Operations (PcO)** - Peace operations seek to mitigate the security effects of physical and psychological strife generated by warring factions in a locality. These local conflicts maybe between groups with cultural, ideological or, sometimes, religious differences. Army forces, due to their combat potential and discipline, maybe called upon to assist or directly conduct peace operations. Generally, Army forces assist in law enforcement tasks that local police and security elements cannot handle. In this type of operations, defining and promulgating the rules of engagement (ROE) acceptable to all stakeholders is of prime importance. Although it may require additional training and education, the TTPs for peace operations that Army forces generate in the local setting may be used and applied in other foreign countries as part of a UN or coalition peacekeeping force applied in troubled spots elsewhere around the globe. Peace Operations may include, but not limited to, the following: 1) **Peace Enforcement Operations (PcEO)** – These involve using Army forces and capabilities in enforcing a peace agreement between warring factions in areas within the national sovereignty, as drafted and approved by the appropriate national agency of government. Most often, these operations will be done under the direction of the Office of the Presidential Adviser on the Peace Process (OPAPP). 2) **Peace Making Operations (PcMO)** – These involve using Army forces and capabilities to respond to and resolve a crisis situation attributed to warring factions. As a rule, the primary consideration is the de-escalation of hostilities to enable peace negotiations. Neutralization and disarmament maybe necessary while open hostilities are happening. 3) **Peace Keeping Operations (PKO)** – These involve using Army forces and capabilities to maintain law and order in spite of the presence of armed combatants in a specific geographical area. This environment exists whether or not a peace accord is in force or not. Most often, disarmament of armed combatants is not necessary. 4) **Disarmament, Demobilization and Rehabilitation Operations (DDRO)** – These involve using Army forces and capabilities to enforce DDR as part of a final peace agreement that is in force. This situation is non-combat in nature and will be enabled by inter-agency coordination and convergence.

c. **Disaster Response Operations (DRO)** - The government and populations look up to Army forces for alleviation from the effects of natural and manmade disasters and terrorist acts. Army forces respond immediately even without the guidance of higher headquarters in order to alleviate suffering and prevent loss of lives and properties. Although some Army units may not have the specific expertise, training or equipment for this purpose, they contribute a disciplined work force at the very least. Immediately after information of the incidence of the disaster, whether natural or manmade, Army forces quickly qualify their response (with appropriate transitions) by conducting the following sub-operations, depending on the situation on the ground, and/or as directed by higher authority: 1) **Disaster Rescue Operations (DRsO)** – These involve using Army forces and capabilities to conduct prompt rescue of affected populations and properties while the disastrous event is happening until immediately after the disastrous event. The primary consideration is to save lives and property from the disastrous event itself. 2) **Disaster Relief Operations (DRfO)** – These involve using Army forces and capabilities to provide relief to affected populations and properties to ensure survival from the effects of the disastrous event. This may happen while the disastrous event is ongoing and may even take months after the event. The primary consideration is to ensure survival of affected populations and properties until civil agencies are able to set into motion programs that will normalize the situation. 3) **Disaster Retrieval Operations (DRvO)** – These involve using Army forces and capabilities to recover casualties and salvage affected properties. This happens as soon as DRsO have ended. The primary consideration is to enable relatives of casualties and local governance to cope up with the losses associated with the disastrous event, according to local customs and traditions. 4) **Disaster Rehabilitation Operations (DRhO)** – These involve using Army forces and capabilities to assist other instruments of national power to bring back normalcy to the affected communities. This may involve reconstruction of damaged facilities and post-trauma treatment of affected populations. 5) **Disaster Mitigation Operations (DMO)** – These involve using Army forces and capabilities to train and inform local populations on how to cope up with disasters and terrorist acts even before they occur through information campaigns and planning of contingency measures in local communities. 6) **Evacuation Center Operations (ECO)** – These involve using Army forces and capabilities to set-up, manage, secure and control evacuation areas for affected populations. The primary consideration is to ensure that the effects of the disastrous event are mitigated and the further worsening of the situation that threatens survival is averted. This will be enabled by inter-agency coordination and convergence.

d. **Civil Population and Vital Installation Security Operations (CPVISO)** - These operations involve protecting the populace and vital installations from external and internal threats. Ideally, Army forces defeat external threats posed by enemy forces that can attack population centers. Simultaneously, they assist local police and security elements as they maintain internal security against terrorists, criminals, and small hostile groups. In some situations, no adequate local capability for civil population and vital installation security exists. Army forces then provide most of the security tasks while developing local

government capabilities. For the other support to civil governance tasks to be effective, civil population and vital installation security is required. As soon the local security forces can safely perform these tasks, Army forces transition security responsibilities to them.Along the same line, securing the populationsometimes entails the regulation of selected behavior and activities of individuals and groups. These operations aimed at reducing risks to individuals or groups while promoting security, includes: 1) **Civil Disturbance Management Operations (CDMO)** – These involve using Army forces and capabilities to stabilize areas affected by violent or seditious gatherings and activities of local populations. This is primarily conducted in support to other agencies of government, especially law enforcement agencies. 2) **Security Operations for Governance Events (SOGE)** – These involve using Army forces and capabilities to secure democratic activities like elections (national and local), public consultations and forums, and other public activities threatened with violence or sabotage by hostile forces or individuals. The primary consideration is the preemption of violence in these activities. 3)**Population Assistance Operations (PAsO)** – These involve using Army forces and capabilities to channel the populace's activities to allow provision of security and essential services while coexisting with a military force conducting operations. A proactive curfew is an example of population assistance. The primary consideration is the isolation of hostile elements from the population and enables the other instruments of national power to address the problematic situation. This is usually done extensively in areas declared by the national government as areas under martial rule, as provided for in the Constitution. 4) **Vital Installation Security Operations (VISO)** – These involve using Army forces and capabilities to protect installations and facilities, critical to the survival or normalcy of a specific locality or the nation as a whole, from hostile elements, foreign or domestic. Vital installations may include power plants, water facilities and the like that have inimical implications to local and national interest. 5) **Counter Terrorism Operations (CTO)** – These involve using Army forces and capabilities to protect populations, installations and facilities from terrorist acts initiated by foreign or local terrorist cells. Such operations are peculiarly different from mere routine security operations of populated areas and vital installations and facilities, as it entails long drawn efforts to identify, track, disrupt or destroy terrorist personalities, cells and activities. The primary consideration is the preemption of terrorist attacks especially those that may result in massive civilian casualties and destruction.

e. **Support to Law Enforcement Operations (SLEO)** - When authorized and directed, Army forces provide support to local and state law enforcement officers in the implementation of the penal and special laws of the land. In extreme cases, and when directed by the President, regular Army forces maintain law and order. These operations must be covered by the appropriate decrees and/or memoranda of understanding or agreement enabled by inter-agency coordination and convergence.

f. **Support to Community Development Operations (SCDO)** - Army forces help establish or restore the most basic services in civilian communities. They initially help protect communities to ensure that initiatives for development

are enhanced and on track. Normally, Army forces support local civilian agencies. When the local government cannot perform its role, Army forces may provide the basics on emergency basis. Essential services that maybe provided immediately include the following: 1) Providing emergency medical care and rescue; 2) Preventing epidemic disease; 3) Providing food and water; 4) Providing emergency shelter; and, 5) Providing basic sanitation (sewage and garbage disposal).These operations then establish conditions that enable actions by local civilian government and agencies to succeed. By establishing security and control, support to civil governance operations provides a foundation for successful governance by the local civilian government. Support to local governance includes the following: 1) Developing and supporting local government control of public activities, the rule of law, and civil administration; 2) Maintaining security, control, and essential services through local civilian agencies. This includes training and equipping local security forces and police; and, 3) Supporting local government efforts to normalize local democratic processes.

g. **Support to Environmental Protection and Development Operations (SEPDO)** – Army forces help a local government, or the national government as a whole, develop capability and capacity in the areas of protecting and developing the environment and ecological equilibrium. It may involve direct and indirect military assistance to local governments, national entities and peoples' organizations at various levels. It may also include initiatives and involvement in environmental projects, and being environmental protection and development advocates themselves.

h. **Non-Critical Support Operations (NCSO)** - The Army is frequently called upon to provide other support to civil authorities. Most of this support is identified well in advance and planned with civil authorities. Much of the support is routine; it usually consists of providing support to communities surrounding Army units' home stations. Examples of types of non-critical support provided to civil authorities include the following: 1) Support to state and local veteran funerals; 2) Participation in major public sporting events; and, 3) Providing military equipment and soldiers to community events.

Purpose of Support to Nation Building Operations

0360. Although Army forces focus on achieving the military end state, they ultimately need to create conditions where the other instruments of national and local power are preeminent. Support to civil governance operations focus on creating those conditions. The following paragraphs discuss the purposes of support to civil governance operations.

a. **Provide a Secure Environment**. A key support to civil governance task is providing a safe, secure environment. This involves isolating enemy fighters from the local populace and protecting the population. By providing security and helping local government authorities control civilians, Army forces begin the process of separating the enemy from the general population. Information engagement complements physical isolation by persuading the populace to

support an acceptable, legitimate local government. This isolates the enemy politically and economically.

b. **Secure Land Areas and Vital Installations**. Effective support to civil governance operations, together with local government capabilities, helps secure land areas and vital installations. Areas of population unrest often divert forces that may be urgently needed elsewhere. In contrast, stable areas may support bases and infrastructure for friendly forces, allowing commitment of forces elsewhere.

c. **Meet the Critical Needs of the Populace**. Often, support to civil governance operations are required to meet the critical needs of the populace. Army forces can provide essential services until the local government or other agencies can do so.

d. **Gain Support for the National and Local Government**. Successful support to civil governance operations ultimately depend on the legitimacy of the national and local government - its acceptance by the populace as the governing body. All support to civil governance operations are conducted with that aim.

e. **Shape the Local Environment for Interagency and Local Government Success**. Support to civil governance operations shape the environment for interagency and local government success. They do this by providing the security and control necessary for local government and interagency elements to function, and supporting them in other key functions.

f. **Security**. Army forces conduct support to civil governance operations to establish and maintain a safe and secure environment, whenever possible together with local, indigenous forces. They provide public order and safety and protect individuals, infrastructure, and institutions. Typically, offensive, defensive, and support to civil governance tasks all support this sector. Civil security and civil control are associated support to civil governance tasks. Initially, Army forces have the lead for this sector. Army operations should complement and be concurrent with other agencies' actions. Army forces hand over responsibility to local government agencies and assume a supporting role as these agencies develop the needed capabilities.The first aim in the security task is to limit adversarial influence and isolate the populace from an enemy. Army forces use several methods to isolate the enemy. Isolation in some support to civil governance operations is indirect; that is, it aims to redirect, compel, and influence the populace away from supporting adversaries and toward supporting the local government. Concurrently, Army forces secure the support of populations in unstable areas. If the enemy poses a significant military threat, forces engaged in special purpose operations defend themselves and the populace from attacks. Army forces may conduct offensive operations to physically isolate, defeat, or destroy forces that threaten the support to civil governance missions. Security is the foremost condition; it underpins all other tasks.

g. **Justice and Reconciliation**. Establishing public order and safety and providing for social reconciliation are some of the more important effects of support to civil governance operations. The local government aims to establish self-sustaining public law and order that operates according to nationally and internationally recognized standards and, respects human rights and freedoms.

h. **Humanitarian Assistance and Social Well-Being during Disasters**. Army forces work to reduce human suffering, disease, and deprivation. Some support to civil governance operations include programs conducted to relieve or reduce the results of conditions that present a serious threat to life, or that can result in great damage to or loss of property. These conditions may be endemic or may result from natural or manmade disasters.

i. **Governance and Participation**. Support to civil governance operations is concerned with restoring or creating effective government institutions. These efforts involve strengthening local governance and rebuilding government infrastructure. They also require developing institutions that achieve sustainable peace and security, foster a sense of confidence, and support conditions for local economic reconstruction and development. The main goal for Army forces is creating an environment conducive to stable local governance. Civilian agencies are responsible for areas such as the following: 1) Re-establishing the administrative framework; 2) Supporting development of local governance; 3) Supporting national, regional or local political reform; and; and, 4) Reforming or establishing fair taxation

j. **Local Economic Stabilization**. Economic stabilization begins with meeting the basic needs of the populace. It continues by restoring economic production and distribution. The basic needs of the populace are met by helping reconstitute the following: 1) Power, 2) Transportation, 3) Communications, 4) Health and sanitation, 5) Firefighting, 6) Mortuary services, and, 7) Environmental control.Once the basic infrastructure is functioning, efforts shift to stabilizing the economy. Economic stabilization consists of the following: 1) Restoring employment opportunities, 2) Initiating market reform, 3) Mobilizing domestic and foreign investment, and, 4) Supervising monetary reform and rebuilding public structures.

Use of Force in Support to Civil Governance Operations

0361. When using force, precision is as important in support to civil governance missions as applying massed, overwhelming force is in offensive and defensive operations. Commanders at every level emphasize that in support to civil governance operations, violence not precisely applied is counterproductive. Speed, surprise, and shock are vital considerations in lethal actions; perseverance, legitimacy, and restraint are vital considerations in support to civil governance operations.

0362. The presence of armed soldiers operating among the local populace causes tension. Discipline and strict adherence to the rules of engagement are essential but not sufficient to reassure the population. In addressing the populace's apprehension, commander's balance protecting the force, defeating hostile forces, and taking constructive action throughout the area of operations. They also stress cultural

awareness in training and preparing for operations. Cultural awareness makes soldiers more effective when operating in an unfamiliar and indigenous population. This also allows them to leverage local culture to enhance the effectiveness of their operations.

0363. Especially in peace operations, commanders emphasize impartiality in the use of force in addition to credibility and transparency. Impartiality is not neutrality. Impartiality does not imply that Army forces treat all sides equally. Force is used against threats in accordance with the rules of engagement. Fair treatment of the local populace improves the prospects for lasting peace, stability, and security.

Combining the Elements of Full Spectrum Operations

0364. Within the concept of operations, the proportion and role of offensive, defensive, and support to civil governance tasks varies based on several factors. Changes in the nature of the operation, the tactics used, and where the environment falls on the spectrum of conflict, affect the mix and focus of every Army operation. Some combinations may be sequential, such as a mobile defense followed by a counteroffensive, but many occur simultaneously. During major combat operations, a division may be attacking in one area, defending in another, and focusing on support to civil governance tasks in a third. Offensive and defensive operations may be complemented with support to civil governance and vice versa at any point of a campaign. Simultaneous combinations are also present in operational environments dominated by support to civil governance. A peace operation, for example, may include a mix of several elements. One force may be conducting a raid against hostile forces (offense), while a second is securing an important installation (defense), and a third is providing sanitary and secure facilities to dislocated civilians(support to civil governance).

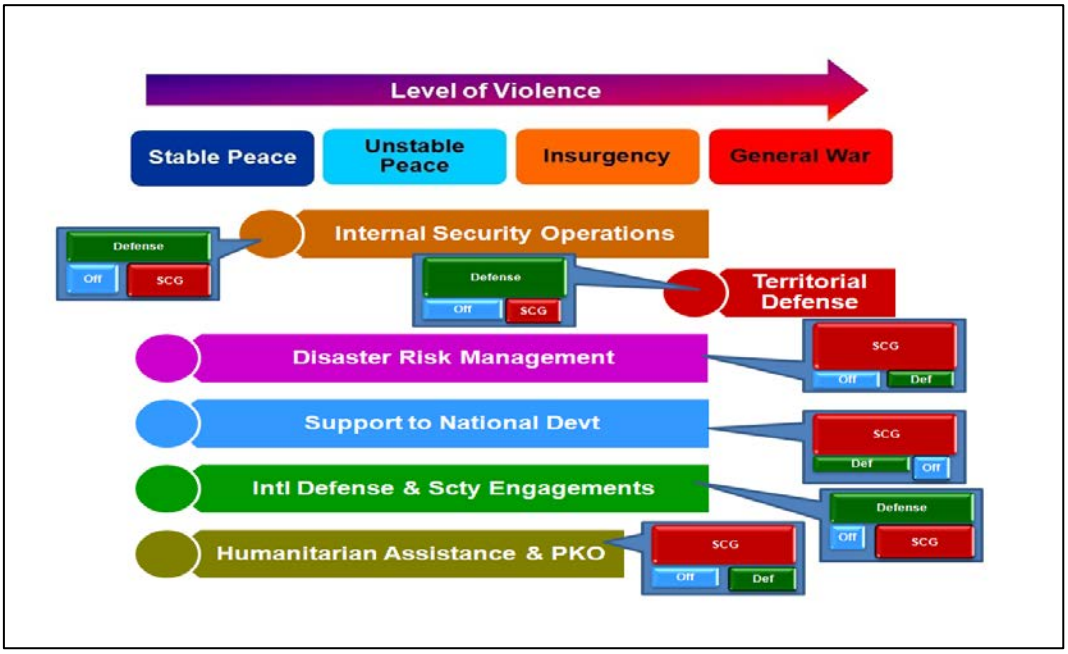

Figure 3.2 - Combining the Elements of Full Spectrum Operations in Different Operational Environments

0365. Differing combinations of the elements of full spectrum operations generally characterize each operational environment. (See Figure 3.2) The combinations vary according to the conditions and requirements for each phase of a campaign or major operation. Commanders determine the weight of effort by considering the primary tasks and purposes for each element within the operational environment and which will be decisive. This allows commanders to translate their design into tactical actions.

0366. Conducting full spectrum operations involves more than simultaneous execution of all its elements. It requires commanders and staffs to consider their units' capabilities and capacities relative to each element. Commanders consider their missions, decide which tactics to use, and balance the elements of full spectrum operations while preparing their concept of operations. They determine which tasks the force can accomplish simultaneously, if phasing is required, what additional resources may be necessary, and how to transition from one element to another. At the operational level, this requires looking beyond the current operation and prioritizing each element for the next phase or sequel.

0367. The transition between elements of full spectrum operations requires careful assessment, prior planning, and unit preparation as commanders shift their combinations of full spectrum operations. This begins with an assessment of the situation to determine which primary tasks are applicable and the priority for each. For example, a division assigns a brigade an area of operations and the tasks of eliminating any enemy remnants, securing a vital installation, and conducting support to civil governance operations following an offensive phase. The brigade commander determines that the brigade will conduct three tasks: an area defense of the vital installation, control the civil population in the area and exclude all civilians from the area of the vital installation, and conduct movements to contact in various objective areas, specifically search and attack operations. Simultaneously, the brigade staff begins planning for the next phase in which civil security, civil control, and assisting the local authorities with essential services will become priorities, while continuing to defend the vital installation. Reconnaissance and surveillance, joint information operations, area and route security operations, and protection are continuous. The commander assigns tasks to subordinates, modifies the brigade task organization, replenishes, and requests additional resources if required. Depending on the length of operations, the higher headquarters may establish unit training programs to prepare units for certain tasks.

0368. When conditions change, commanders adjust the combination of the elements of full spectrum operations in the concept of operations. When an operation is phased, these changes are included in the plan. The relative weight given to each element varies with the actual or anticipated conditions. It is reflected in tasks assigned to subordinates, resource allocation, and task organization. The concept of full spectrum operations, per se, is not a phasing method. Commanders consider the concurrent conduct of each element - offense, defense, and support to civil governance - in every phase of an operation.

0369. Seizing, retaining, and exploiting the initiative requires commanders to interpret developments and shift the weight of effort throughout their operations to achieve decisive results. As they do this, the forces and priorities they assign to each element

of full spectrum operations change. Throughout an operation, commanders constantly adapt and perform many tasks simultaneously. Commanders change tactics, modify their command and control methods, change task organization, and adjust the weight placed on each element of full spectrum operations to keep the force focused on accomplishing the mission. They base these decisions on the situation, available resources, and the force's ability to execute multiple, diverse tasks. Commanders' assessments should consider the progress of ongoing operations, changes in the situation, and how the rules of engagement affect the force's effectiveness in each element. Commanders not only assess how well a current operation is accomplishing the mission, but also how its conduct is shaping the situation for subsequent missions.

0370. Applying tactical and operational art in full spectrum operations involves knowing when and if simultaneous combinations are appropriate and feasible. Every operation does not require offensive tasks; support to civil governance may be the only elements executed. Nonetheless, commanders and staffs always consider each element of full spectrum operations and its relevance to the situation. An element may be unnecessary, but it is the commander who determines that. Not every echelon or unit necessarily executes simultaneous full spectrum operations.

0371. Division and higher echelon operations normally combine three elements simultaneously. Brigades may focus exclusively on a single element when attacking or defending, shifting priority to another element as the plan or situation requires. Battalion and smaller units often execute the elements sequentially, based on their capabilities and the situation. However, simultaneous execution of offensive, defensive, and support to civil governance tasks at lower echelons is common in irregular warfare and peace operations. Sometimes the force available is inadequate for executing simultaneous combinations of offensive, defensive, and support to civil governance tasks. In these cases, commanders inform the higher headquarters of the requirement for additional forces.

0372. Regardless of the situation, commanders assess the risk to units and mission accomplishment. Combining elements of full spectrum operations requires the following:

a. A clear concept of operations that establishes the role of each element and how it contributes to accomplishing the mission.

b. A flexible command and control system.

c. Clear situational understanding.

d. Aggressive intelligence gathering and analysis.

e. Aggressive security operations.

f. Units that can quickly change their task organization.

g. An ability to respond quickly.

h. Responsive sustainment.

i. Army power applied through combined arms, including applicable joint capabilities.

Army Power

0373. Army Power is the summation of the potency that any total Army force generates. (See Figure 3.3) It consists of eight warfighting functions tied together by leadership and enhanced by information. Army forces apply Army power most effectively through combined arms. The platform of combined arms generates more Army power than employing the arms individually. Army forces are organized for combined arms using force tailoring and task organization. Mutual support used in reinforcing and complementary combinations also multiples the effects of Army power.

0374. Full spectrum operations require continuously generating and applying Army power, often for extended periods. Army power is the total means of destructive, constructive, and information capabilities that a military unit/formation can apply at a given time. Army forces generate power by converting potential into effective action.

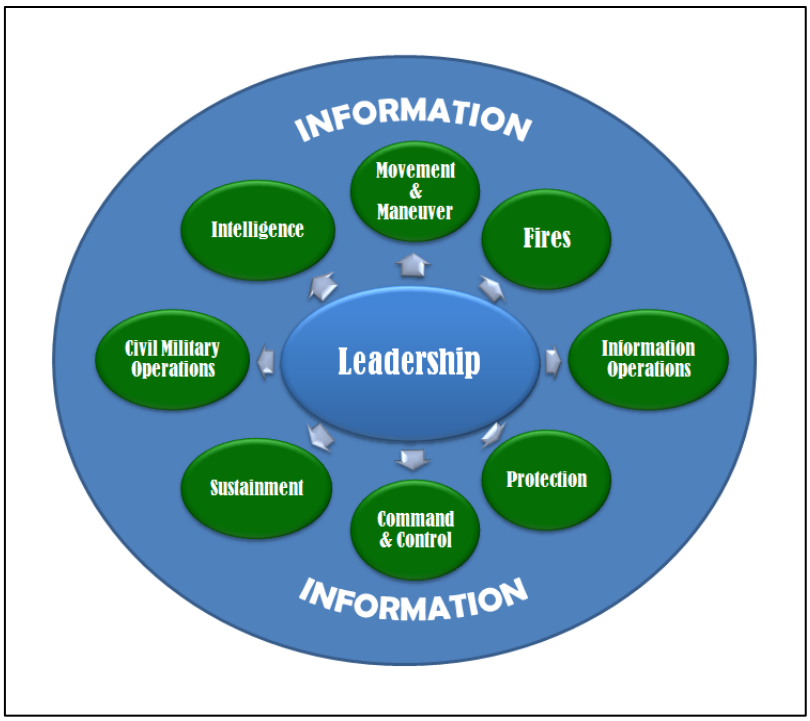

Figure 3.3 - The Elements of Army Power

0375. Commanders conceptualize capabilities in terms of Army power. There are ten elements of Army power. These are leadership, information, movement and maneuver, intelligence, fires, information operations (IO), civil military operations (CMO), sustainment, command and control, and protection. Leadership and information are applied through, and multiply the effects of the other eight elements of Army power. The other eight - movement and maneuver, intelligence, fires,

information operations (IO), civil military operations (CMO), sustainment, command and control, and protection - are collectively described as the warfighting functions. Commanders apply Army power through the warfighting functions using leadership and information.

0376. In full spectrum operations, every Army unit - regardless of type - either generates or maintains Army power. All contribute to operations. Commanders ensure deployed Army forces have enough potential Army power to combine the elements of full spectrum operations in ways appropriate to conditions. Ultimately, Army forces combine elements of Army power to defeat the enemy and master critical situations.

0377. Commanders balance the ability to mass lethal and nonlethal effects with the need to deploy and sustain the units that produce those effects. They balance accomplishing the mission quickly with being able to project and sustain the force. Generating and maintaining Army power throughout an operation is essential to success. Commanders tailor force packages to maximize the capability of the force. They must generate endurance and ability to operate in depth. Many factors contribute to generating Army power. These include the following:

a. Employing reserves.

b. Focusing joint support.

c. Rotating committed forces.

d. Staging sustainment assets to preserve momentum and synchronization.

0378. Army power is not a numerical value. It can be estimated but not quantified. Army power is always relative. It has meaning only in relation to conditions and enemy capabilities. It is relevant solely at the point in time and space where it is applied. In addition, how an enemy generates and applies its adversarial power may fundamentally differ from that of Army forces. It is dangerous to assume that enemy capabilities are a mirror image of friendly capabilities. Before an operation, Army power is unrealized potential. Through leadership and a detailed description of the concept of use of the different elements in the concept of operation, this potential is transformed into action.

0379. Commanders use information to integrate and enhance action. Information is also applied through the warfighting functions to shape the operational environment and complement action. Army power becomes decisive when applied by skilled commanders leading well-trained soldiers and units. Ultimately, commanders achieve success by applying superior Army power at the decisive place and time.

The Elements of Army Power

Leadership

0380. Leadership is applied through soldiers to the warfighting functions. Leadership is the multiplying and unifying element of Army power. Confident, competent, and

informed leadership intensifies the effectiveness of all other elements of combat power by formulating sound operational ideas and assuring discipline and motivation in the force. Good leaders are the catalysts for success. Effective leadership can compensate for deficiencies in all the warfighting functions because it is the most dynamic element of Army power. The opposite is also true; poor leadership can negate advantages in warfighting capabilities.

0381. The Army defines *leadership* as the process of influencing people by providing purpose, direction, and motivation, while operating to accomplish the mission and improving the organization. An Army leader, by virtue of assumed role or assigned responsibility, inspires and influences people to accomplish organizational goals. Army leaders motivate people to pursue actions, focus thinking, and shape decisions for the greater good of the organization. They instill in soldiers the will to win. Army doctrine describes essential leadership attributes (character, presence, and intellect) and competencies (lead, develop, and achieve). These attributes and competencies mature through lifelong learning.

0382. Leaders influence not only soldiers, but other people as well. Leadership is crucial in dealing with civilians in any conflict or disaster. Face-to-face contact with people in the area of operations encourages cooperation between civilians and soldiers. Army leaders work with members of other services and civilian organizations. The Army requires self-aware, adaptive leaders who can both defeat an enemy in combat and master the complexities of operations dominated by support to civil governance operations.

0383. Leadership in today's operational environment is often the difference between success and failure. Leaders provide purpose, direction, and motivation in all operations. Through training and by example, leaders develop cultural awareness in soldiers. This characteristic improves the soldiers' ability to cope with the ambiguities of complex environments. Leadership ensures that soldiers understand the purpose of operations and use their full capabilities. In every operation, Army leaders clarify purpose and mission, direct operations, and set the example for courage and competence. They hold their soldiers to the Army Core Values and ensure that their soldiers comply with the laws of war and rules of engagement.

Information

0384. Information is a powerful tool in the operational environment. In modern conflict, information has become as important as lethal action in determining the outcome of operations. Every engagement, battle, and major operation requires complementary information operations to both inform a national audience and to influence audiences within the operational area; it is a weapon against enemy command and control and is a means to affect enemy morale. It is both destructive and constructive. Commanders use information to understand, visualize, describe, and direct the warfighting functions. Soldiers constantly use information to persuade and inform target audiences. They also depend on data and information to increase the effectiveness of the warfighting functions.

0385. Since information shapes the perceptions of the civilian population, it also shapes much of the operational environment. All parties in a conflict use information

to convey their message to various audiences. These include hostile forces, adversaries, and neutral and friendly populations. Information is critical in support to civil governance operations where the population is a major factor in success. While the military tasks are essential for success, without complementary information engagement that explains these actions to the population, success may be unattainable. Information must be proactive as well as reactive. The enemy adeptly manipulates information and combines message and action effectively. Countering enemy messages with factual and effective friendly messages can be as important as the physical actions of soldiers. The effects of each warfighting function should complement information objectives (the message) while information objectives stay consistent with soldiers' actions.

0386. The joint force and total Army force continues to modernize information systems. These improvements provide leaders with the information necessary to enhance and focus the warfighting functions. Leadership based on relevant information enables the commander to make informed decisions on how best to apply Army power. Ultimately, this creates opportunities to achieve decisive results. Information disseminated by information systems allows leaders at all levels to make better decisions quickly. The common operational picture lets Army forces use lethal and nonlethal actions more effectively than the enemy can. For example, accurate intelligence disseminated quickly by information systems allows friendly forces to maneuver around enemy engagement areas while massing the effects of Army power at the decisive place and time. This reduces friendly casualties and may allow a small force to defeat a larger enemy force.

0387. Commanders use the concept of information superiority (See Chapter 7) and its three information-related contributors to understand and visualize the role of information in their operational environment. They use various information capabilities to shape the operational environment.

Warfighting Functions

0388. Commanders use the warfighting functions to help them exercise battle command. A warfighting function is a group of tasks and systems (people, organizations, information, and processes) united by a common purpose that commanders use to accomplish missions and training objectives. Decisive, shaping, and sustaining operations combine all the war fighting functions to generate Army power. No warfighting function is exclusively decisive, shaping, or sustaining. The Army's warfighting functions are fundamentally linked to the joint functions.

a. **Movement and Maneuver.** The movement and maneuver warfighting function is the related tasks and systems that move forces to achieve a position of advantage in relation to the enemy. Direct fire is inherent in maneuver, as is close combat. The function includes tasks associated with force projection related to gaining a positional advantage over an enemy. Maneuver is the employment of forces in the operational area through movement in combination with fires to achieve a position of advantage in respect to the enemy in order to accomplish the mission. Maneuver is the means by which commanders mass the effects of Army power to achieve surprise, shock, and momentum. Effective maneuver requires close coordination with fires.

Movement is necessary to disperse and displace the force as a whole or in part when maneuvering. Both tactical and operational maneuver require logistic support. The movement and maneuver warfighting function includes the following tasks: 1) Deploy, 2) Move, 3) Maneuver, 4) Employ direct fires, 5) Occupy an area, 6) Conduct mobility and counter-mobility operations, and, 7) Employ battlefield obscuration.The movement and maneuver warfighting function does not include administrative movements of personnel and materiel. These movements fall under the sustainment warfighting function.

b. **Intelligence.** The intelligence warfighting function is the related tasks and systems that facilitate understanding of the operational environment, enemy, terrain, and civil considerations. It includes tasks associated with intelligence, surveillance, and reconnaissance (ISR) operations, and is driven by the commander. Intelligence is more than just collection. It is a continuous process that involves analyzing information from all sources and conducting operations to develop the situation. The intelligence warfighting function includes the following tasks: 1) Support to force generation, 2) Support to situational understanding, 3) Conduct ISR, and, 4) Provide intelligence support to targeting and information capabilities.

c. **Fires.** The fires warfighting function is the related tasks and systems that provide collective and coordinated use of Army indirect fires, joint fires, and command and control warfare, including nonlethal fires, through the targeting process. It includes tasks associated with integrating and synchronizing the effects of these types of fires and command and control warfare - including nonlethal fires - with the effects of other warfighting functions. These are integrated into the concept of operations during planning and adjusted based on the targeting guidance. Fires normally contribute to the overall effect of maneuver but commanders may use them separately for the decisive operation and shaping operations. The fires warfighting function includes the following tasks: 1) Decide surface targets, 2) Detect and locate surface targets, 3) Provide fire support, 4) Assess effectiveness, and, 5) Integrate command and control warfare, including nonlethal fires.

d. **Civil Military Operations**. Civil Military Operations are planned activities undertaken independently or in coordination with civilian entities to gain popular support and weaken the will of the enemy to fight. It has three pillars according to the AFP CMO doctrine: Public Affairs (PA), Civil Affairs (CA) and Information Support Affairs (ISA). **Public Affairs** are information-related activities and capabilities directed to the external public to ensure a clear, accurate, and timely dissemination of information. It is conducted to establish & maintain constructive relations with communities. It is also conducted to gain the peoples' trust, support & confidence. It has two components: 1) Public Information (PI) which are information activities directed to the public to ensure a clear, accurate, and timely dissemination of information; and, 2) Community Relations (COMREL) which are activities that establishes and maintains constructive relations with the communities through information activities in order to promote the organization's objectives. **Civil Affairs** are activities and capabilities undertaken independent of or in coordination with civilian entities that promotes public trust through

cooperation, collaboration and conduct of sociological and developmental activities. They are also conducted to gain popular support. It has two components: 1) Civil Relations (CIVREL) which are activities that promote cooperation and collaboration between the military and civilians in order to gain popular support; and, 2) Civic Action (CIVAC) which are military initiated activities with developmental and sociological purposes in order to gain popular support. **Information Support Affairs (ISA)**are activities and capabilities conducted to influence the emotions, attitudes, beliefs, opinions and behavior (EABOB) of target audiences. It is conducted to redirect unfavorable attitudes and behavior into favorable, or transform neutral or passive attitude and behavior to become favorable. It has three components: 1) Words ISAs which are activities that involves the dissemination of any information, concepts or ideas through the various media to influence the EABOB of the target audience; 2) Deeds ISAs which are activities that involves the conduct of combat and non-combat activities, outside of pure communication activities, to influence the EABOB of the target audience; and, 3) Counter Propaganda which are activities that involves the conduct of activities in response to enemy propaganda.Each of the components of the three pillars requires population-oriented capabilities and skills that are used towards a defined effect, most of which are especially important in support to civil governance operations.

e. **Information Operations.** Information Operations are the integrated and synchronized use of selected military and non-military capabilities to affect friendly, neutral, and adversarial human and automated decision-making systems while protecting our own. Information Operations integrates and synchronizes use of selected military and non-military capabilities to affect desired audiences in order to carry out three (3) basic functions: Inform, Attack and Protect. It seeks to harness the combined effects of different military capabilities as orchestrated by the staff officer for operations.Although IO is a contributor to Information Superiority as an enabling operation, modern use of Army forces have emphasized the role of information activities that directly affect the outcome of purely military operations and that of support to civil governance operations. As one media personality would put it when asked how we can use the media and project ourselves in them so that Army operations will be acceptable to the people in the locality affected by the operation, he said that Army forces must offer a certain degree of transparency in what they are doing. The people expect that the Army is their protector and conducting military actions without some certain degree of openness creates a cloud of doubt as to whether the Army is really for the protection of the people. He added that for every military action, the Army unit must immediately explain to the people affected the purpose of the operation without violating operational security. If the Army unit will not anticipate that, people will form their own story and most probably, it will be to the detriment of the Army unit, especially in so far as winning popular support is concerned.

f. **Sustainment.** The sustainment warfighting function is the related tasks and systems that provide support and services to ensure freedom of action, extend operational reach, and prolong endurance. The endurance of Army forces is primarily a function of their sustainment. Sustainment determines the depth and

duration of Army operations. It is essential to retaining and exploiting the initiative. Sustainment is the provision of logistics, personnel services, and health service support necessary to maintain operations until mission accomplishment. Internment, resettlement, and detainee operations fall under the sustainment warfighting function and include elements of all three major sub-functions which are; 1) **Logistics.** The science of planning and carrying out the movement and maintenance of forces. In its most comprehensive sense, those aspects of military operations that deal with: the design and development, acquisition, storage, movement, distribution, maintenance, evacuation, and disposition of materiel; the movement, evacuation, and hospitalization of personnel; the acquisition or construction, maintenance, operation, and disposition of facilities; and, the acquisition or furnishing of services. Although joint doctrine defines it as a science, logistics involves both military art and science. Knowing when and how to accept risk, prioritizing myriad requirements, and balancing limited resources all require military art. Logistics integrates strategic, operational, and tactical support of deployed forces while scheduling the mobilization and deployment of additional forces and materiel. Logistics includes maintenance, transportation, supply, field services, distribution, contracting and general engineering support. 2) **Personnel.** Personnel services are those sustainment functions related to soldiers' welfare, readiness, and quality of life. Personnel services complement logistics by planning for and coordinating efforts that provide and sustain personnel. Personnel services include human resources support, financial management, legal support, religious support and band support. 3) **Health Support**. Health service support consists of all support and services performed, provided, and arranged by the Army medical units. It promotes, improves, conserves, or restores the mental and physical well-being of soldiers and, as directed, other personnel. This includes casualty care, which involves all Army Medical functions, including organic and area medical support, hospitalization, dental care, behavioral health and neuropsychiatric treatment, clinical laboratory services and treatment of chemical, biological, radiological, and nuclear patients, medical evacuation and medical logistics. Health service support closely relates to force health protection.

g. **Command and Control.** The command and control warfighting function is the related tasks and systems that support commanders in exercising authority and direction. It includes those tasks associated with acquiring friendly information, managing relevant information, and directing and leading subordinates. Through command and control, commanders integrate all warfighting functions to accomplish the mission. The command and control war fighting function includes the following tasks: 1) Execute the operations process; 2) Conduct command post operations; 3) Integrate the information superiority contributors - the Army information tasks, ISR, knowledge; 4) Management and information management; 5) Conduct information engagement; 6) Conduct civil affairs activities; and, 7) Execute command programs.The command and control warfighting function is the primary integrator of information tasks associated with information superiority. Army leaders use information tasks to shape the operational environment throughout the operations process. During operations against an enemy, they degrade the enemy's ability to do the same.

h. **Protection**. The protection warfighting function is the related tasks and systems that preserve the force so the commander can apply maximum Army power. Preserving the force includes protecting personnel (combatants and non-combatants), physical assets, and information of the Philippines and other military and civilian partners. The protection warfighting function facilitates the commander's ability to maintain the force's integrity and Army power. Protection determines the degree to which potential threats can disrupt operations and counters or mitigates those threats. Emphasis on protection increases during preparation and continues throughout execution. Protection is a continuing activity; it integrates all protection capabilities to safeguard bases, secure routes, and protect forces. The protection warfighting function includes the following tasks: 1) Personnel recovery; 2) Information protection; 3) Fratricide avoidance; 4) Operational area security; 5) Antiterrorism; 6) Survivability; 7) Force health protection; 8) Chemical, biological, radiological, and nuclear operations; 9) Safety; 10) Operations security; and, 11) Explosive ordnance disposal. The protection warfighting function includes force health protection. Force health protection includes all measures to promote, improve, or conserve the mental and physical well-being of soldiers. These measures enable a healthy and fit force, prevent injury and illness, and protect the force from health hazards. The measures include the prevention aspects of a number of Army Medical functions, including the following: 1) Preventive medicine; 2) Medical surveillance; 3) Occupational and environmental health surveillance; 4) Veterinary services; 5) Food inspection; 6) Animal care; 7) Prevention of zoometric diseases (those transmitted from animals to humans, such as plague or rabies); 8) Combat and operational stress control; 9) Dental services (preventive dentistry); and, 10) Laboratory services (area medical laboratory support).

Army Power in Combined Arms Operations

0389. Applying Army power in a combined arms operation enables it to achieve its full destructive, disruptive, informational, and constructive potential. Combined arms operations merge leadership, information, and each of the warfighting functions and their supporting systems more effectively. Used destructively, combined arms operations integrate different capabilities so that counteracting one makes the enemy vulnerable to another. Used constructively, combined arms operationsmultiply the effectiveness and the efficiency of the different Army capabilities used in support to civil governance operations.

0390. Combined arms operations use the capabilities of each warfighting function and information in complementary and reinforcing capabilities. Complementary capabilities protect the weaknesses of one system or organization with the capabilities of a different warfighting function. For example, commanders use artillery (fires) to suppress an enemy bunker complex pinning down an infantry unit (movement and maneuver). The infantry unit then closes with and destroys the enemy. In this example, the fires warfighting function complements the maneuver warfighting function using different arms. Reinforcing capabilities combine similar systems or capabilities within the same warfighting function to increase the function's overall

capabilities. In urban operations, for example, infantry and armor (movement and maneuver) often operate closely together. This combination reinforces the protection, maneuver, and direct fire capabilities of each. The infantry protects armored assets from enemy infantry and antitank systems; armored assets provide protection and firepower for the infantry. Together, these capabilities form a lethal team built on movement and maneuver. In another example, multiple artillery units routinely mass fires in support of a committed artillery battalion (reinforcement). Joint capabilities, such as close air support and special operations forces can complement or reinforce Army forces' capabilities.

0391. Combined arms operations are primary nature to Army forces. Unified actions - those integrating the capabilities of joint forces with those of military and civilian organizations - have become typical as well. This integration requires careful preparation. Training and exchange of liaison at every level are necessary for successful unified action.

0392. Combined arms operations multiply Army forces' effectiveness in all operations. Units operating without support of other capabilities generate less Army power and may not accomplish their mission. Conducting combined arms operations require highly trained soldiers, skilled leadership, effective staff work, and integrated information systems. Commanders synchronize combined arms operations to apply the effects of Army power to its best advantage. The sequence and simultaneity of combined arms actions vary with both the operational or tactical design, and in execution. Typically, intelligence, surveillance, and reconnaissance activities begin soon after receipt of mission and continue throughout preparation and execution. They do not cease after mission accomplishment, but continue as needed. Sustainment and protection are conducted constantly but may peak before and after execution. Maneuver and fires complement each other continuously but sometimes precede each other. For example, the commander conducts preparatory lethal fires combined with nonlethal electronic warfare to isolate and destroy enemy forces on an objective before maneuver forces make contact. Another example is the shifting of fires beyond the immediate vicinity of maneuver units during a pursuit.

0393. Combined arms operations are conducted through organizational design and temporary reorganization. When required, these capabilities are added through force tailoring and task organization. Higher echelons achieve combined arms capabilities by tailoring and task-organizing different types of brigades and battalions under division headquarters. For example, a division commander may complement or reinforce several brigades with any or all of the modular support units and functional units.

0394. Asymmetric warfare, including counterinsurgency operations, requires a combined arms approach emphasizing small-unit capabilities and information tasks. It also requires a mix of forces different from conventional warfare to address the fundamental differences between them. Since asymmetric warfare concerns the struggle for control and influence over a population, task organizations need to reflect this. Furthermore, requirements that characterize counterinsurgency in general, and civil security and civil controlling in particular, vary significantly among tactical-level areas of operations. This situation requires releasing intelligence, civil affairs, and information assets typically held at higher headquarters to brigades and often to

battalions. Unified action at lower echelons characterizes asymmetric warfare. Liaison officers and adjacent unit coordination are essential to integrating and synchronizing Army operations with those of other organizations. Higher headquarters may need to reinforce the command and control capabilities of their subordinates to improve coordination between them and the various organizations in their areas of operations.

Force Tailoring

0395. Force tailoring is the process of determining the right mix of forces and the sequence of their deployment in support of a joint force commander or a combined arms commander. It involves selecting the right force structure for a joint or combined arms operation from available units within a combatant command or from the Army force pool. Joint force or combined arms commanders request and receive forces for each campaign phase, adjusting the quantity and component of forces to match the weight of effort required. Army Service component commanders tailor Army forces to meet land force requirements determined by joint force and combined arms commanders. Army Service component commanders also recommend forces and a deployment sequence to meet those requirements. Force tailoring is continuous and must conform to the obtaining situation within the operating environment.

Task Organizing

0396. Task-organizing is art of designing an operating force, support staff, or logistic package of specific size and composition to meet a unique task or mission. Characteristics to examine when task organizing the force include, but are not limited to: training, experience, equipage, sustainability, operating environment, threat, and mobility. For Army forces, it includes allocating available assets to subordinate commanders and establishing their command and support relationships. Task-organizing occurs within a tailored force package as commanders organize groups of units for specific missions. It continues as commanders reorganize units for subsequent missions. The ability of Army forces to task-organize gives them extraordinary agility. It lets operational and tactical commanders configure their units to best use available resources. It also allows Army forces to match unit capabilities rapidly to the priority assigned to offensive, defensive and support to civil governance tasks.

Mutual Support

0397. Commanders consider mutual support when task-organizing forces and assigning areas of operations and positioning units. Mutual support is that support which units render each other against a hostile force, because of their assigned tasks, their position relative to each other and to the hostile force, and their inherent capabilities. In Army doctrine, mutual support is a planning consideration related to force disposition, not a command relationship. Mutual support has two aspects -

supporting range and supporting distance. Understanding mutual support and accepting risk during operations are fundamental to the art of tactics.

Supporting Range

0398. It is the distance one unit may be geographically separated from a second unit yet remain within the maximum range of the second unit's weapons systems. It depends on available weapons systems and is normally the maximum range of the supporting unit's indirect fire weapons. For small units (such as squads, sections, and platoons), it is the distance between two units that their direct fires can cover effectively. Supporting range may be limited by visibility; if one unit cannot effectively or safely fire in support of another, the first may not be in supporting range even though its weapons have the required range.

Supporting Distance

0399. It is the distance between two units that can be travelled in time for one to come to the aid of the other and prevent its defeat by a hostile force or ensure it regains control of a civil situation. The factors that affect supporting distance are terrain and mobility, distance, enemy capabilities, friendly capabilities and reaction time. When friendly forces are static, supporting range equals supporting distance.

03100. Supporting distance and supporting range are affected by the command and control capabilities of supported and supporting units. Units may be within supporting distance, but if the supported unit cannot communicate with the supporting unit, the supporting unit may not be able to affect the operation's outcome. In such cases, the units are not within supporting distance, regardless of their proximity to each other. If the units share a common operational picture, the situation may be quite different. Relative proximity may be less important than both units' ability to coordinate their maneuver and fires. To exploit the advantage of supporting distance, the units must be able to synchronize their maneuver and fires more effectively than the enemy can. Otherwise, the enemy may be able to defeat both units in detail.

03101. Commanders also consider supporting distance in operations dominated by support to civil governance. Units maintain mutual support when one unit can draw on another's capabilities. An interdependent joint force may make proximity less significant than available capability. For example, Air Force assets may be able to move a preventive medicine detachment from an intermediate staging base to an operational area threatened by an epidemic. Additional treatment capability might be moved to the operational area based on the threat to soldiers and the populace.

03102. Improved access to joint capabilities gives commanders additional means to achieve mutual support. Those capabilities can extend the operating distances between Army units. Army commanders can substitute joint capabilities for mutual support between subordinate forces. Doing this multiplies supporting distance many times over. Army forces can then extend operations over greater areas at a higher tempo. Joint capabilities are especially useful when subordinate units operate in noncontiguous areas of operations that place units beyond supporting distance or supporting range. However, depending on them entails accepting risk.

Field Operational Framework for Full Spectrum Operations

03103. The field operational framework for full spectrum operations is basically the arrangement of friendly forces and resources in time, space, and purpose with respect to each other and the enemy or situation. The framework establishes an area of geographic and operational responsibility, and provides a way for commanders to visualize how to employ forces against the enemy or based on the situation on the ground. Commanders design an operational framework to accomplish their mission by focusing Army power.

03104. This field operational framework is conceptually within an **operational space** that includes the environment, factors, and conditions commanders must understand to successfully apply Army power, protect the force, or complete a mission. This includes the air, land, sea, space, and the included enemy and friendly forces, facilities, weather, terrain, the electromagnetic spectrum, and the information environment within the specified geographical area. The following are the elements found in the operational space:

Area of Operations

03105. One of the most basic and important control measures is the area of operations. The Army or ground force commander is the supported commander within that area of operations designated by the unified commander. Within their areas of operations, commanders integrate and synchronize maneuver, fires, and interdiction. To facilitate this integration and synchronization, commanders have the authority to designate targeting priorities and timing of fires within their areas of operations. Commanders consider a unit's area of influence when assigning it an area of operations. An area of operations should not be substantially larger than the unit's area of influence. Ideally, the entire area of operations is encompassed by the area of influence. An area of operations that is too large for a unit to control can allow sanctuaries for enemy forces and may limit joint flexibility.

03106. Assigning areas of operations to subordinate commanders maximizes decentralized execution by empowering those commanders to exercise initiative. Mission command gives commanders the authority to create any effects necessary to accomplish the mission (consistent with the rules of engagement) within their areas of operations. However, commanders cannot create effects outside their areas of operations without permission from the commander assigned the area of operations in which those effects will occur. Further, commanders must control all parts of their area of operations not assigned to subordinates. Assignment of an area of operations includes authority to perform the following:

a. Terrain management

b. Intelligence collection

c. Civil affairs activities

d. Air and ground movement control

e. Clearance of fires

f. Security

03107. Subordinate unit areas of operations may be contiguous or non-contiguous. (See Figure 3.4) A common boundary separates contiguous areas of operations. Non-contiguous areas of operations do not share a common boundary; the concept of operations provides procedural control of elements of the force. An *unassigned area* is the area between non-contiguous areas of operations or beyond contiguous areas of operations. The higher headquarters is responsible for controlling unassigned areas within its area of operations. Designating an unassigned area only indicates that the area is not assigned to a subordinate. Unassigned areas remain the responsibility of the controlling headquarters.

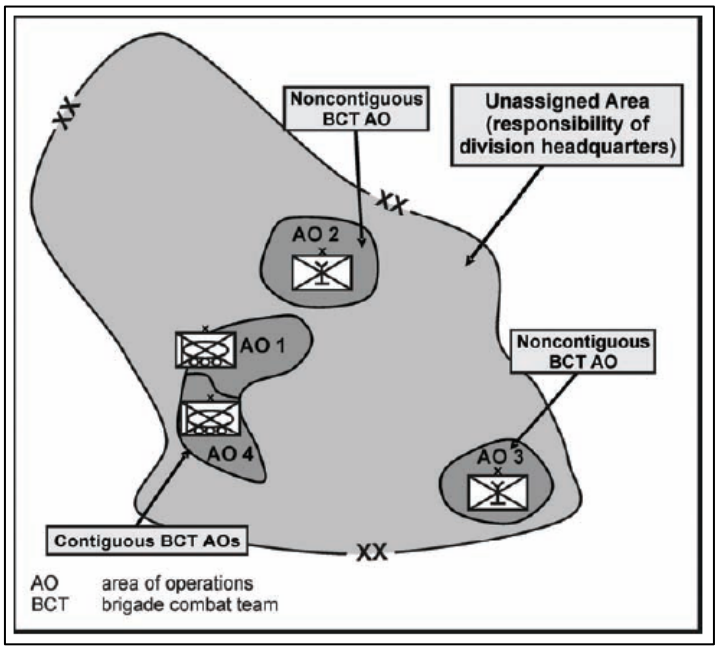

Figure 3.4 - Contiguous, Non-Contiguous and Unassigned Areas

Area of Influence and Area of Interest

03108. Every Army echelon has an associated area of influence and area of interest for every operation. An **area of influence** is a geographical area in which a commander can directly influence operations by maneuver or fire support systems normally under the commander's command or control. Areas of influence surround and include the associated AO. The extent of subordinate units' areas of influence normally guides higher commanders in assigning subordinate AOs. An AO should not be substantially larger than the unit's area of influence. Understanding the command's area of influence helps the commander and staff plan branches to the current operation that could require the force to use capabilities outside the area of operations.

An **area of interest** is that area of concern to the commander, including the area of influence and areas adjacent to it. It extends into enemy territory and to the objectives of current or planned operations. This area also includes areas occupied by enemy forces that could jeopardize the accomplishment of the mission. Areas of interest serve to focus intelligence development and IO directed at factors outside the AO that may affect the operation. The area of interest for support to civil governance operations may be much larger than that associated with offensive and defensive operations.

The Information Environment

03109. A commander's operational space includes that part of the information environment that encompasses information activity affecting the operation. The information environment contains information activities that collect, process, and disseminate information to national and international audiences but are beyond direct military influence. It includes systems that provide data and information to Army forces. To envision that part of the information environment that is within their operational space, commanders determine the information activities that affect their operation and the capabilities of their own and opposing C2 and information systems.

Field Organization

03110. As part of the military decision making process, commanders visualize their operational space and determine how to arrange their forces. The *field organization* is the allocation of forces in the AO by purpose. It consists of three all-encompassing categories of operations: decisive, shaping, and sustaining. Purpose unifies all elements of the field organization by providing the common focus for all actions. Commanders organize forces according to purpose by determining whether each unit's operation will be decisive, shaping, or sustaining. These decisions form the basis of the concept of operations. When circumstances require a spatial reference, commanders describe the AO in terms of deep, close, and rear areas. These spatial categories are especially useful in operations that are generally contiguous and linear and feature a clearly defined enemy force.

Decisive Operations

03111. The decisive operation is the operation that directly accomplishes the mission. It determines the outcome of a major operation, battle, or engagement. The decisive operation is the focal point around which commanders design the entire operation. Multiple units may be engaged in the same decisive operation. For example, one task force may follow another on an axis of advance, prepared to assume the attack. Units operating in noncontiguous areas of operations may execute the tasks composing the higher headquarters' decisive operation simultaneously in different locations. Commanders visualize the decisive operation and then design shaping and sustaining operations around it.

03112. Changing the mission normally changes the decisive operation. This can occur because of a change of phase but is more typical in the conduct of branches and sequels. When Army forces transition to a new operation, through either mission accomplishment or a significant change in the situation, the commander identifies a new decisive operation. Any element of full spectrum operations can be the decisive operation, as can a specific task, such as movement to contact or mobile defense. The commander decides. In a protracted support to civil governance operation, for example, the commander may identify a task in a particular area as the decisive operation.

Shaping Operations

03113. A shaping operation is an operation at any echelon that creates and preserves conditions for the success of the decisive operation. Shaping operations establish conditions for the decisive operation through effects on the enemy, population (including local leaders), and terrain. Information engagement, for example, may reduce tensions between Army units and different ethnic groups through direct contact between Army leaders and local leaders. Shaping operations may occur throughout the operational area and involve any combination of forces and capabilities.

03114. Shaping operations may occur before, during, or after the decisive operation begins. Some shaping operations, especially those executed simultaneously with the decisive operation, may be economy of force actions. However, if the force available does not permit simultaneous decisive and shaping operations, the commander sequences shaping operations around the decisive operation. The concept of operations describes how shaping operations contribute to the decisive operation's success, often in terms of the purpose.

Sustaining Operations

03115. A sustaining operation is an operation at any echelon that enables the decisive operation or shaping operations by generating and maintaining Army power. Sustaining operations differ from decisive and shaping operations in that they are focused internally (on friendly forces) rather than externally (on the enemy or environment). They typically address important sustainment and protection actions essential to the success of decisive and shaping operations. However, sustaining operations cannot be decisive themselves. Note that logistic and medical support provided to the civilian population are tasks related to support to civil governance operations (provide essential services); they are not sustaining operations. At the operational level, sustaining operations focus on preparing the force for the operation's next phase. They determine the limit of operational reach. At the tactical level, sustaining operations determine the tempo of the overall operation; they ensure the force is able to seize, retain, and exploit the initiative.

03116. Sustaining operations are continuous; commanders do not reiterate routine sustainment requirements in the concept of operations. Rather, the concept of operations emphasizes important changes in sustainment required by the operation.

Main Effort

03117. The concept of operations identifies a main effort unit if required; otherwise, the priorities of support go to the unit conducting the decisive operation. The main effort is the designated subordinate unit whose mission at a given point in time is most critical to overall mission success. It is usually weighted with the preponderance of Army power. Designating a main effort temporarily prioritizes resource allocation. When commanders designate a unit as the main effort, it receives priority of support and resources. Commanders shift resources and priorities to the main effort as circumstances and the commander's intent require. Commanders may shift the main effort several times during an operation. A unit conducting a shaping operation may be designated as the main effort until the decisive operation commences. However, the unit with primary responsibility for the decisive operation becomes the main effort upon execution of the decisive operation.

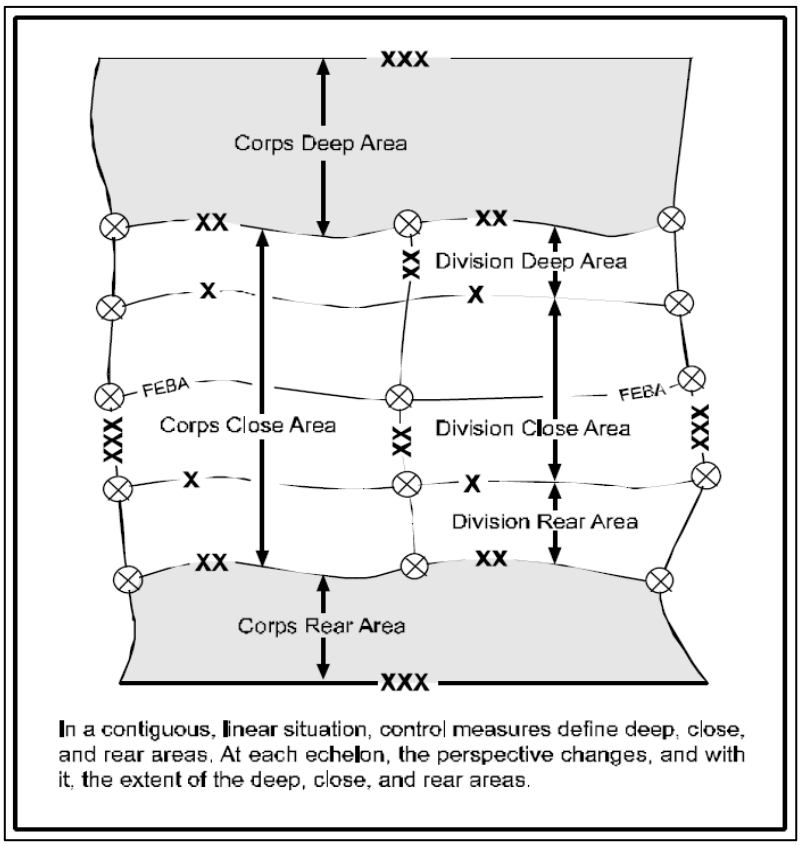

Close, Deep, and Rear Areas

03118. Despite the increasing nonlinear nature of operations, there may be situations where commanders describe decisive, shaping, and sustaining operations in spatial terms (See Figure 3.5). Typically, linear operations involve conventional combat and concentrated maneuver forces. Ground forces share boundaries and orient against a similarly organized enemy force. Terrain or friendly forces secure flanks and protect sustainment support operations. In some multinational operations, the capabilities and doctrine of partners may dictate spatial organization of the AO. In such situations, commanders designate close, deep, and rear areas.

a. **Close Areas**. When designated, the *close area* is where forces are in immediate contact with the enemy and the fighting between the committed forces and readily available tactical reserves of both combatants is occurring, or where commanders envision close combat taking place. Typically, the close area assigned to a maneuver force extends from its subordinates' rear boundaries to its own forward boundary. Commanders plan to conduct decisive operations through maneuver and fires in the close area and position most of the maneuver force within it. The activities of forces directly supporting fighting elements also occur in the close area. Examples of these activities are field artillery fires and combat health support. Within the close area, depending on echelon, one unit may conduct the decisive operation while others conduct shaping operations.

b. **Deep Areas**. When designated, the *deep area* is an area forward of the close area that commanders use to shape enemy forces before they are encountered or engaged in the close area. Typically, the deep area extends from the forward boundary of subordinate units to the forward boundary of the controlling echelon. Thus, the deep area relates to the close area not only in terms of geography but also in terms of purpose and time. The extent of the deep area depends on the force's area of influence; how far out it can acquire information and strike targets. Commanders may place forces in the deep area to conduct shaping operations. Some of these operations may involve close combat. However, most maneuver forces stay in the close area.

c. **Rear Areas**. When designated, the *rear area* for any command extends from its rear boundary forward to the rear boundary of the next lower level of command. This area is provided primarily for the performance of support functions and is where the majority of the echelon's sustaining operations occur. Operations in rear areas assure freedom of action and continuity of operations, sustainment, and C2. Their focus on providing operational support and sustainment support leaves units in the rear area vulnerable to attack. Commanders may designate combat forces to protect forces and facilities in the rear area. In some cases, commanders may designate a noncontiguous rear area due to geography or other circumstances. In this case, the rear area force protection challenge increases due to physical separation of forces in the rear area from maneuver units that would otherwise occupy a contiguous close area.

In a contiguous, linear situation, control measures define deep, close, and rear areas. At each echelon, the perspective changes, and with it, the extent of the deep, close, and rear areas.

Figure 3.5 - Field Organization in Spatial Terms: Close, Deep and Rear Areas

Chapter IV
The Foundations of Full Spectrum Operations

"A professional Army draws its strength from its professional soldiers who are better trained, well-equipped and more responsive to the needs and aspirations of the people they have sworn to serve and protect."

Gen Diomedio P Villanueva

0401. Full spectrum operations relies heavily on human resources – officers and soldiers and its attendant systems - that possess the moral ascendancy, the character, technical expertise and value systems drawn from universally-accepted concepts of human martial behavior and thinking.

0402. The foundations of full spectrum operations are anchored on time-tested standards of individual military behavior and successful military operations. They are the yardsticks from which Army soldier conduct and operations will be measured against. These standards exemplify the required professionalism and character of an Army soldier and the benchmarks of successful military operations. If the fundamentals of full spectrum operations are the flesh and bones of Army operations, the foundations of full spectrum operations comprise the soul of Army operations, both from the individual and collective perspective.

The Professionalism and Character of an Army Soldier

0403. The following are the beliefs and standards of character that every member of the Philippine Army, whether officer, enlisted personnel or civilian employee, must possess:

Philippine Army Service Precepts

Universal Belief in the Divine Providence

0404. The Philippine Army believes in a Divine Providence that is the source of its strength and well-being. As guaranteed by the Constitution, every individual has the freedom to choose his religion and practice it. Military rules and regulations, however, deter its unrestricted practice that may disrupt military operations, ceremonies and procedures, without prejudice towards any religion. Army leaders therefore should recognize and strive to attend to the spiritual needs of its soldiers as these form the character and foundation of the value system of every individual soldier. Along the same line and as much as possible, the Army avoids to fight wars and conflicts that are based on religion.

Respect for Human Rights and International Laws of Warfare

0405. Respect for Human Rights is one of the fundamental qualities of a civilized society, especially in a democracy such as ours. The state will always ensure that its citizens will have the freedom to develop themselves where the protection of their basic human rights is the cornerstone. In fact, our constitution is very specific about the freedoms and rights that Filipinos should enjoy, which the state should protect and uphold. More so, the Philippines is a signatory to the Universal Declaration of Human Rights, a statement affirming the dignity and rights of all human beings, adopted by the United Nations (UN) in 1948. It is based on principles expressed in the UN Charter. The declaration is the first section of a proposed three-part international covenant, or agreement, on human rights. When it was adopted, the covenant bounded the participating nations in the same way as any international treaty. The two remaining sections of the covenant amplify the initial declaration in specific and enforceable terms. One is concerned with civil and political rights, and the other with economic, social, and cultural rights.

0406. The rights described in the 30 articles of the Universal Declaration of Human Rights include the right to life, liberty, and security of person; to freedom of conscience, religion, opinion, expression, association, and assembly; to freedom from arbitrary arrest; to a fair and impartial trial; to freedom from interference in privacy, home, or correspondence; to a nationality; to a secure society and an adequate standard of living; to education; and to rest and leisure. The declaration also affirms the rights of every person to own property; to be presumed innocent until proven guilty; to travel from a home country at will and return at will; to work under favorable conditions, receive equal pay for equal work, and join labor unions at will; to marry and raise a family; and to participate in government and in the social life of the community.

0407. As a party to the said declaration, the Philippine Army is also duty-bound to uphold its provisions and spirit as the Army is an extension of state policy. Soldiers must remember that it is because of the savage effects of military operations that this declaration was made. It must therefore be factored in their concepts of operation when conducting full spectrum operations. It must serve as a limiting factor to military operations and consistent with the laws of the land. As a sworn defender of the Filipino people, the soldier must be a champion of human rights.

0408. Consistent with upholding human rights, the Filipino soldier also adheres to the international laws on war and conflicts codified by the Geneva Conventions. The Geneva Conventions is a series of international agreements that created and developed international humanitarian law to protect wounded combatants and those who assist them, prisoners of war, and civilians during times of war or other conflicts.

0409. There have been four Geneva Conventions, each of which has subsequently been amended. The first Geneva Convention was adopted in 1864 and provided for the protection of sick and wounded soldiers on the field of battle. The second convention, formulated in 1906, extended those protections to sailors wounded in sea battles. The third convention, in 1929, protected prisoners of war (POWs). It legislated that POWs are not criminals, should be treated humanely, and should be released at the end of hostilities. The fourth convention, ratified in 1949, rewrote,

expanded, and replaced the language of the first three conventions. The fourth convention also provided for the protection of civilians during wartime. It brought civilians under the protection of international laws that prohibit murder, torture, hostage-taking, and extra-judicial sentencing and executions.

0410. Consequently, humanitarian law, also known as “the laws of war,” is comprised of the Geneva Conventions and the 1899 and 1907 Hague Conventions. Whereas the Geneva Conventions primarily protect victims of war, the Hague Conventions and accompanying regulations primarily protect combatants and non-combatants by limiting the methods and means of combat. The Hague regulations protect prisoners of war; prohibit poisonous weapons and weapons calculated to cause unnecessary suffering; and killing or wounding an enemy who has surrendered.

0411. In 1977, two protocols were added to the Geneva Conventions of 1949. Protocol I extends the law relating to protections of victims of armed conflicts to situations where people are fighting in the exercise of their right of self-determination against colonial domination, foreign occupation, or racist regimes. Protocol II extends protection to victims of internal conflicts in which an armed opposition controls enough territory to enable it to carry out sustained military operations.

0412. Officers and soldiers of the Philippine Army are expected to adhere to international humanitarian law and other accords pertaining to wars and conflicts, especially since the Philippines is an official signatory to it. It is therefore a mandatory requirement that all concepts of operations in conducting the range of military operations in full spectrum operations be bounded by the spirit and provisions of such international laws and accords of war and conflict. Filipino soldiers are gentlemen warrior soldiers who adhere to international standards.

Army Core Values

0413. The Philippine Army core philosophy focuses on values that are the basis of the Army soldier's daily existence. It is the foundation of all his acts and deeds. These are the ties that bind. With the country moving forward in nation building, these values have shown their enduring quality and have provided the Army soldier with the time-tested tools for the future.

a. **Honor**. Honor is the military's crowning value, the hallmark of military conduct, the quality of the soldier's consciousness of personal dignity and self-worth. From prelude and campaign to the aftermath, the solider carries his honor in meeting the military imperative. No matter the arena, honor is respected in one's self as in the other. In outward form, honor is seen in cleanliness of the person, courtesy in manners, decency in daily living and prudence in the use of personal or country resources. It shows in the candor, honesty and straightforwardness in speech, as well as in actions. When one leads an honorable life, he is perceived of good reputation; deferred to because of his credibility and sincerity; and emulated for his uprightness and transparency in all his dealings. Facts are identified as facts just as one's opinions are taken for what they are. Honor also means integrity. Integrity is the foundation of the character that is embedded in the soldier's thinking, feeling or doing. It is a requirement in both leadership and esprit-de-corps. It is

expected in one and sought for in the other because it cements the bonds of professionalism between and among commanders and the men under them. For those in positions of authority, one leads by example especially in this respect.

b. **Patriotism**. Foremost among the values of a Filipino soldier is his unwavering love for his country. It is the foremost nature of an Army soldier to love his country. The country is the land of his birth, the cradle of his people. It is for the country that a soldier willingly commits to a life of service. This is the highest value that the Filipino soldier possesses. It is not measured by money or rank or possessions, and it endures through him and is kept alive by those after him. It is the energy that drives the soldier as the defender of national sovereignty. He stands by his oath of service with a stout heart, knowing that even if he is ultimately left standing alone or when dying in the battlefield, he rests content with the thought that his reason for existence has been fulfilled. It is this love of country that pervades every citation of valor for deserving soldiers, valor that further uplifts the spirit of the nation.

c. **Duty**. Duty is not imposed. It derives its authority from the soldier's steadfast commitment to the service of the country. Any civilian and any person intending to join the military service must understand that the soldier's dedication to the military life is incomparable to a civilian's job, for a soldier makes himself available for duty at all times. His is not a commercial transaction or a 0800 to 1700 job because he wills himself to put the interest of the country and the service above all others, including his own personal agenda. Duty is a continuous process that is cultivated by both the challenges faced on the job as well as the discipline in the service. Duty is exercised in peace when in support of all legal initiatives of the civilian authority, more so in war that may take the very life of the person himself. The exacting standard of duty also requires that those in command positions discharge their responsibilities to the fullest, making the care and interests of their subordinates of paramount concern within the constraints of discipline, to elicit the high level of commitment that the service deserves.

"On 18 March 1991, while on his way to join his unit from visiting his family, Corporal Romualdo C Rubi chanced upon a group of communist terrorists numbering about one hundred attacking a nearby Philippine Constabulary detachment in Barangay Hayanggabon, Claver, Surigao del Sur. Faced with imminent danger, he bravely responded to the call of duty and engaged the superior enemy force in a gun battle immediately hitting three of them. A roaring volley of enemy fires was then focused on him but CplRubi managed to maneuver and establish a defensive position. Eight terrorist suddenly dashed towards his position but with firm determination, he singlehandedly confronted the approaching enemies, hitting them at close range, killing three of them and wounding the rest. The enraged enemy commander ordered to kill the courageous soldier with M203 grenade launcher and M60 Machine gun fires, but even this did not deter him to fight the advancing enemy. After about an hour of intense firefight, he fatally hit the enemy commander. The encounter resulted to eight enemies killed including its commander and wounding of three others and earned Corporal Rubi the Medal for Valor, the highest military award for conspicuous gallantry and intrepidity at the risk of the life above and beyond the call of duty."

Excerpt from the Medal of Valor citation

Standards of Conduct of an Army Soldier

Pursuit of Excellence

0414. A soldier powered by the pursuit of excellence is not readily seen, for the soldier operates in silence though he carries the organization with him. Within each soldier, there lies the competence necessary to attain outstanding performance in any place. He has full knowledge of his job he has proficiency in training, in combat requirements, in peacekeeping, and in the implementation of national policies for development. He has the unparalleled wealth of combat experience within the context of a dynamic security environment. Hence, pursuit of excellence is seen in the utmost efficiency and maximum use of the soldier's abilities with the prudent use of resources available to him. It is a continuing goal that, when achieved in any endeavor, reaps the full confidence, morale, esprit-de-corps, and pride that the soldier carries as the symbol of the military spirit.

0415. Historically, even when reduced to the barest of fighting paraphernalia, the pursuit of excellence remained constant such as when the guerrillas were recognized for their best weapons: "silence, invisibility, and speed". The best weapon in the unit is the individual himself, thus the Army endeavors to develop that individual to be the most potent weapon. And as one continually strives to perfect his craft and achieve his mission, the soldier becomes more confident in his mission and his uniform assumes a whole new significance.

Pride in the Uniform

0416. In any legitimate army of any sovereign country, the military uniform reflects one's pride in being the guardian of his country. Each soldier carries the Army on his shoulders, projecting an image of strength and more suggestively, the core values for which the Army stands. He also projects humility in such strength and invites reliance by his fellow countrymen on the Army symbolized by his uniform.

0417. The manner of wearing the uniform is therefore a manifestation of the state of the Army. It reflects not only the personality and character of the individual soldier but also that of the whole organization. It is the responsibility of the soldier to take extra care and use of his uniform and all insignias he carries on them, for it is in this simple ritual that the soldier is set apart from the rest. Embedded in the uniform is the extraordinary patriotism and dedication that begets respect and admiration from the people he serves.

0418. The uniform is also the symbol of integrity and discipline in the service; thus, any damage deliberately done thereto or any soldier appearing in civilian clothing without authority, or appearing in unclean uniform, or not in the prescribed uniform, or in uniform but worn otherwise than in the prescribed manner constitute serious misconduct warranting punishment of equal severity, if only to reinforce the importance of the profession and the steadfast commitment required of it. This commitment is also an unconditional acceptance of the discipline that accompanies the immense responsibility for one bearing arms.

Discipline

0419. A soldier is a model of self-discipline. As he follows the disciplined path, he generates the same quality of discipline from those he walks with. In this manner, disciplined governance from the Chain of Command is correspondingly achieved especially since a Philippine Army soldier performs excellently under the tutelage of an excellent commander. The soldier and ultimately the Philippine Army's energy come from this unity of disciplined purpose. Thus, the Philippine Army operates in a uniform and collective manner, requiring a continuous regimen of training, practice, self-responsible conduct, and complete obedience to authority.

0420. Good discipline conquers fear and the best discipline, which is self-discipline, conquers all. This means continuing the fight even when alone and to the last man; staying alert when all others are asleep; and keeping to the objective when all else seems lost. This is more than being fierce in battle; it is being true to the noble warrior spirit in all of us.

0421. Discipline is equally vital to preservation of life as much as to the success of military operations, and demands unconditional compliance as its foremost aspect. It requires that each person in authority must be able to enforce it when necessary and the follower must, in turn, be confident in following the orders for battle. Discipline may be rigorous but history has shown that fairness and equality in its application has and will continue to work in war as well as in peace. And, it is rigorous training enforced with discipline that kicks in when theory is tested in actual combat. Each disciplined soldier generates pride from the people he is protecting. Many challenges have been resolved with the mere presence of a disciplined array of soldiers with characteristic military bearing, ready at a moment's notice to respond to a command from one of equal bearing. It is discipline that is the bedrock of the military profession just as professionalism enhances and projects the discipline required to carry out the soldier's mission.

0422. Discipline is also enforced throughout the Army by adhering and subscribing to the Articles of War, especially the Punitive Articles and the Manual for Courts Martial. These are time-tested and internationally recognized laws for soldierly conduct.

Professionalism

0423. Professionalism in the military career stands for commitment, knowledge, and skills and is better expressed in one's attention to duty with the required discipline and competence. Each soldier is guided by standards of military professionalism that embody the core values of the Philippine Army and more particularly spelled out in issuances of the AFP, and the various branches of government. Professionalism comes from the soldier's pursuit of excellence; his disciplined performance as to When, Where and How; the recognition of individual merit; humility where respect is earned and not coveted; and most of all, humor in being human and in keeping one's feet on the ground. This prescription comes from a battle-hardened general who rose through the ranks and consistently believes that military professionalism can only pave the way for peace rather than insurgency, and stability rather than conflict in the country.

0424. Professionalism in the soldier gives rise to impartiality, objectivity, and non-partisanship that is necessary to support common goals for the welfare of the population. It stresses reliance on competence and ability rather than personality. Professionalism and uniformity in the military does not breed anonymity that allows the soldier to get lost in the crowd, but instead fosters the correct perception of the uniqueness of the soldier's mission. The professional soldier is recognized as fully equipped to handle threats to the country's security and stability, and to be relied upon for nation building, whether in war or in peace. It is this recognition that spells the difference between civilian support and rejection of any military initiative.

Adherence to Law

0425. The Armed Forces of the Philippines is an organization that operates pursuant to the policy direction of the National Command Authority. As a field of service of the AFP, the Philippine Army and each soldier is committed to follow orders that are pursuant to such national policy. Each soldier, therefore, does not individually determine how policies of the government will be carried out, for it is the military leadership in the chain of command that takes responsibility for this. Moreover, members of the Philippine Army are both citizens and military personnel; hence all soldiers are subject to the same law and shall uphold the same as part of their duty of service to the Country. The Constitution, the Articles of War, the various coded laws, the law on Ethical Standard and Public Accountability, and all other general special laws are to be followed as the minimum standard of conduct expected of a military man.

0426. In case of conflict, the higher military standard of conduct, required under the same set of circumstances in either system, is always paramount. Likewise, in the absence of an order or lack of knowledge on how a member of the military shall act in unfamiliar situations, or in non-traditional roles, or even in the absence of an order, the value system and the standard of conduct contained herein is to be consistently followed.

0427. The supremacy of civilian authority places the burden of responsibility for such policy on the civil government, implemented only by the military upon being appropriately handed down through the chain of command. The dilemma facing the Philippine army soldier will occur only if the directive handed down through the chain of command is patently irreconcilable with the convictions of the soldier tasked with carrying out the order, such as when military personnel refused to fire on friendly and unarmed civilians who surrounded them at EDSA in 1986. In this situation, the propriety of following orders was no longer the issue in the face of the preservation of civilian life for a rightful cause that had become paramount. Military doctrine recognizes this reality in its basic doctrine:

*"*While *the military fights wars, it is done so only as an instrument of public policy which the government initiates. While war is primarily an instrument of violence, it is subject to limitations as to means, objective, and conduct" (AFP Basic Doctrine).*

Deference to Authority

0428. Authority refers to those with the right and responsibility to carry out functions that affect an entire group. Within the military, authority is evident in the chain of command, starting with the non-commissioned officer in the most vital role as implementer, and the succession of Commanding Officers before him through which commands are progressively issued and implemented at each level of the hierarchy. Persons in position of authority within the military are entrusted with carrying out the military operational imperative and discipline ensures this is followed. This should not be confused with civil authority, which provides the policies to be implemented by the Army as a whole organization. Military authority is inherent in its position as well as earned. It is recognition of a soldier's right to command within his level of the military organization. It is also a factor of solidarity for when one leads with distinction; his success carries all of his men. Military ceremonies, traditions, customs and practices honor the chain of command and show the best side of discipline exhibited by the soldier.

0429. Deference to civil authority is likewise required of the soldier as a function of his responsibility, for it is his response that can either influence the outcome of a critical situation or even determine the stability of the authority in power. In this respect a soldier, despite being confined by the bounds of his mission, can rely on civilian authority to the extent that life is preserved and the goal is achieved. While instances may arise wherein such deference may result in unwarranted results, a professional soldier acting in accordance with the Philippine Army's core philosophy can and will be able to carry the responsibility for decision made in the course of duty and as required by circumstances. It is his professionalism that will be his protection and his guide for action. By being true to himself and to the people he serves, the soldier can thus face the conflict of ideas and actions that normally characterize daily life, for his mission is lofty yet simple, profound and yet workable in the daily crucible of life.

Benchmarks of Successful Military Operations

0430. Successful military operations rely on many factors, some of which are immeasurable and intangible. History has shown that not all successful military campaigns or operations possess the same winning formulas. However, history also points out aspects of successful military operations that must be addressed that will invariably increase the chances of mission success. These aspects form the benchmarks of successful military operations.

The Principles of Army Operations

0431. The Principles of Army Operations represent the most important non-physical factors that affect the conduct of operations at the strategic, operational, and tactical levels when conducting full spectrum operations. The Principles of Army Operations

do not represent a checklist. While they are considered in all operations, they do not apply in the same way to every situation. Rather, they summarize characteristics of successful operations. Their greatest value lies in the education of the military professional. Applied to the study of past campaigns, major operations, battles, and engagements, the Principles of Army Operations are powerful tools for analysis.

Objective

0432. **Direct every military operation toward a clearly defined, decisive, and attainable objective**.The principle of objective drives all military activity. At the operational and tactical levels, objective ensures all actions contribute to the higher commander's end state. When undertaking any mission, commanders should clearly understand the expected outcome and its impact. Combat power is limited; commanders never have enough to address every aspect of the situation. Objectives allow commanders to focus combat power on the most important tasks. Clearly stated objectives also promote individual initiative. These objectives clarify what subordinates need to accomplish by emphasizing the outcome rather than the method. Commanders should avoid actions that do not contribute directly to achieving the objectives.

0433. The purpose of military operations is to accomplish the military objectives that support achieving the conflict's overall political goals. In offensive and defensive operations, this involves destroying the enemy and his will to fight. The objective of stability or civil support operations may be more difficult to define; nonetheless, it too must be clear from the beginning. Objectives must contribute to the operation's purpose directly, quickly, and economically. Each tactical operation must contribute to achieving operational and strategic objectives.

0434. Military leaders cannot dissociate objective from the related joint principles of restraint and legitimacy, particularly in stability operations. The amount of force used to obtain the objective must be prudent and appropriate to strategic aims. Means used to accomplish the military objective must not undermine the local population's willing acceptance of a lawfully constituted government. Without restraint or legitimacy, support for military action deteriorates, and the objective becomes unobtainable.

Offensive

0435.**Seize, retain, and exploit the initiative.**As a Principle of Army Operations, offensive is synonymous with initiative. The surest way to achieve decisive results is to seize, retain, and exploit the initiative. Seizing the initiative dictates the nature, scope, and tempo of an operation. Seizing the initiative compels an enemy to react. Commanders use initiative to impose their will on an enemy or adversary or to control a situation. Seizing, retaining, and exploiting the initiative are all essential to maintain the freedom of action necessary to achieve success and exploit vulnerabilities. It helps commanders respond effectively to rapidly changing situations and unexpected developments.

0436. In combat operations, offensive action is the most effective and decisive way to achieve a clearly defined objective. Offensive operations are the means by which a military force seizes and holds the initiative while maintaining freedom of action and achieving decisive results. The importance of offensive action is fundamentally true across all levels of war. Defensive operations shape for offensive operations by economizing forces and creating conditions suitable for counterattacks.

Mass

0437. **Concentrate the effects of Army power at the decisive place and time**.Commanders mass the effects of Army power in time and space to achieve both destructive and constructive results. Massing in time applies the elements of Army power against multiple decisive points simultaneously. Massing in space concentrates the effects of combat power against a single decisive point. Both can overwhelm opponents or dominate a situation. Commanders select the method that best fits the circumstances. Massed effects overwhelm the entire enemy or adversary force before it can react effectively.

0438. Army forces can mass lethal and nonlethal effects quickly and across large distances. This does not imply that they accomplish their missions with massed fires alone. Swift and fluid maneuver based on situational understanding complements fires. Often, this combination in a single operation accomplishes what formerly took an entire campaign.

0439. In combat, commanders mass the effects of Army power against a combination of elements critical to the enemy force to shatter its coherence. Some effects may be concentrated and vulnerable to operations that mass in both time and space. Other effects may be spread throughout depth of the operational area, vulnerable only to massing effects in time.

0440. Mass applies equally in operations characterized by support to civil governance. Massing in a support to civil governance operation includes providing the proper forces at the right time and place to alleviate suffering and provide security. Commanders determine priorities among the elements of full spectrum operations and allocate the majority of their available forces to the most important tasks. They focus Army power to produce significant results quickly in specific areas, sequentially if necessary, rather than dispersing capabilities across wide areas and accomplishing less.

Economy of Force

0441. **Allocate minimum essential combat power to secondary efforts**.Economy of force is the reciprocal of mass. Commanders allocate only the minimum Army power necessary to shaping and sustaining operations so they can mass Army power for the decisive operation. This requires accepting prudent risk. Taking calculated risks is inherent in conflict. Commanders never leave any unit without a purpose. When the time comes to execute, all units should have tasks to perform.

Maneuver

0442. **Place the enemy in a disadvantageous position through the flexible application of combat power.**Maneuver concentrates and disperses Army power to keep the enemy at a disadvantage. It achieves results that would otherwise be more costly. Effective maneuver keeps enemy forces off balance by making them confront new problems and new dangers faster than they can counter them. Army forces gain and preserve freedom of action, reduce vulnerability, and exploit success through maneuver. Maneuver is more than just fire and movement. It includes the dynamic, flexible application of all the elements of Army power. It requires flexibility in thought, plans, and operations. In operations dominated by support to civil governance operations, commanders use maneuver to interpose Army forces between the population and threats to security and to concentrate capabilities through movement.

Unity of Command

0443. **For every objective, ensure unity of effort under one responsible commander.**Applying a force's full Army power requires unity of command. Unity of command means that a single commander directs and coordinates the actions of all forces toward a common objective. Cooperation may produce coordination, but giving a single commander the required authority is the most effective way to achieve unity of effort.

0444. The joint, interagency, intergovernmental, and multinational nature of unified action creates situations where the commander does not directly control all organizations in the operational area. In the absence of command authority, commanders cooperate, negotiate, and build consensus to achieve unity of effort.

Security

0445. **Never permit the enemy to acquire an unexpected advantage.**Security protects and preserves Army power. Security results from measures a command takes to protect itself from surprise, interference, sabotage, annoyance, and threat surveillance and reconnaissance. Military deception greatly enhances security.

Surprise

0446. **Strike the enemy at a time or place or in a manner for which he is unprepared.**Surprise is the reciprocal of security. It is a major contributor to achieving shock. It results from taking actions for which the enemy is unprepared. Surprise is a powerful but temporary combat multiplier. It is not essential to take enemy forces completely unaware; it is only necessary that they become aware too late to react effectively. Factors contributing to surprise include speed, operations security, and asymmetric capabilities.

Simplicity

0447. **Prepare clear, uncomplicated plans and clear, concise orders to ensure thorough understanding**.Plans and orders should be simple and direct. Simple plans and clear, concise orders reduce misunderstanding and confusion. The situation determines the degree of simplicity required. Simple plans executed on time are better than detailed plans executed late. Commanders at all levels weigh potential benefits of a complex concept of operations against the risk that subordinates will fail to understand or follow it. Orders use clearly defined terms and graphics. Doing this conveys specific instructions to subordinates with reduced chances for misinterpretation and confusion.

0448. Multinational operations put a premium on simplicity. Differences in language, doctrine, and culture complicate them. Simple plans and orders minimize the confusion inherent in this complex environment. The same applies to operations involving inter-agency and non-governmental organizations.

Perseverance

0449.**Ensure the commitment necessary to attain the national strategic end state**.Commanders prepare for measured, protracted military operations in pursuit of the desired national strategic end state. Some joint operations may require years to reach the desired end state. Resolving the underlying causes of the crisis may be elusive, making it difficult to achieve conditions supporting the end state. The patient, resolute, and persistent pursuit of national goals and objectives often is a requirement for success. This will frequently involve diplomatic, informational, and economic measures to supplement military efforts. In the end, the will of the Filipino public, as expressed through their elected officials and advised by expert military judgment, determines the duration and size of any military commitment.

0450. Army forces' endurance and commanders' perseverance are necessary to accomplish long-term missions. A decisive offensive operation may swiftly create conditions for short-term success. However, protracted support to civil governance operations, executed simultaneously with defensive and offensive tasks, may be needed to achieve the strategic end state. Commanders balance their desire to enter the operational area, accomplish the mission quickly, and depart against broader requirements. These include the long-term commitment needed to achieve national goals and objectives.

Legitimacy

0451. **Develop and maintain the will necessary to attain the national strategic end state**.For Army forces, legitimacy comes from three important factors. First, the operation or campaign must be conducted under Philippine laws. Second, the operation must be conducted according to international laws and treaties recognized by the Philippines, particularly the law of war. Third, the campaign or operation should develop or reinforce the authority and acceptance for the both the governed and the international community. This last factor is frequently the decisive element.

0452. Legitimacy is also based on the will of the Filipino people to support the mission. The Filipino people's perception of legitimacy is strengthened if obvious national or humanitarian interests are at stake. Their perception also depends on their assurance that Filipino lives are not being placed at risk needlessly or carelessly, thus, putting premium to the protection of individual human rights, adherence to the rule of law and International Humanitarian Law is paramount.

0453. Committed forces must sustain the legitimacy of the operation and of the government, where applicable. Security actions must balance with the need to maintain legitimacy. Commanders must consider all actions potentially competing for strategic and tactical requirements. All actions must exhibit fairness in dealing with competing factions where appropriate. Legitimacy depends on the level of consent to the force and to the government, the people's expectations, and the force's credibility.

Restraint

0454.**Limit collateral damage and prevent the unnecessary use of force**.Restraint requires careful and disciplined balancing of security, the conduct of military operations and the desired strategic end state. Excessive force antagonizes those friendly and neutral parties involved. Hence, it damages the legitimacy of the organization that uses it while potentially enhancing the legitimacy of any opposing party. The rules of engagement must be carefully matched to the strategic end state and the situation. Commanders at all levels ensure their personnel are properly trained in rules of engagement and quickly informed of any changes. Rules of engagement may vary according to national policy concerns but should always be consistent with the inherent right of self-defense.

0455. Restraint is best achieved when rules of engagement issued at the beginning of an operation address a range of plausible situations. Commanders should consistently review and revise rules of engagement as necessary. Additionally, commanders should carefully examine them to ensure that the lives and health of soldiers are not needlessly endangered.

The Tenets of Army Operations

0456. The tenets of Army operations build on the Principles of Army Operations. They further describe the characteristics of successful Army operations. These tenets are essential to victory. While they do not guarantee success, their absence risks failure.

Initiative

0457. Initiative has both operational and individual components. From an operational perspective, *initiative* is setting or dictating the terms of action throughout the battle or operation. Initiative implies an offensive spirit in all operations. To set the terms of battle, commanders eliminate or reduce the number of enemy options. To be responsive in support to civil governance operations, they act to prevent the situation to worsen. They compel the enemy to conform to friendly operational purposes and tempo, while retaining freedom of action. Army leaders anticipate events throughout

the operational space. Through effective command and control (C2), they enable their forces to act before and react faster than the enemy does or before the situation worsens.

0458. From an individual perspective, initiative is the ability to be a self-starter, to act when there are no clear instructions or when the situation changes. An individual leader with initiative is willing to decide and initiate independent actions when the concept of operations no longer applies or when an unanticipated opportunity leading to the accomplishment of the commander's intent presents itself. Despite advances in C2 from digital technology, individual initiative remains important for successful operations. In battle, leaders exercise this attribute when they act independently within the framework of the commander's intent. They trust their subordinates to do the same. Disciplined initiative requires well-trained and competent leaders who carry out studied and considered actions.

0459. Initiative requires delegating decision making authority to the lowest practical level. Commanders give subordinates the greatest possible freedom to act. They encourage aggressive action within the commander's intent by issuing mission-type orders. Mission-type orders assign tasks to subordinates without specifying how to accomplish them. Such decentralization frees commanders to focus on the critical aspects of the overall operation. Using mission-type orders requires individual initiative exercised by well-trained, determined, disciplined soldiers. It also requires leaders who trust their subordinates and are willing to take and underwrite risks.

0460. In the offense, initiative involves throwing the enemy off balance with powerful, unexpected strikes. It implies never allowing the enemy to recover from the initial shock of an attack. To do this, commanders mass the effects of Army power and execute with speed, audacity, and violence. They continually seek vulnerable spots and shift their decisive operation when opportunities occur. To retain the initiative, leaders press the fight tenaciously and aggressively. They accept risk and push soldiers and systems to their limits. Retaining the initiative requires planning beyond the initial operation and anticipating possible events. The higher the echelon, the more possibilities the commander must anticipate and the further in advance the staff must plan.

0461. In the defense, initiative implies quickly turning the tables on the attacker. It means taking aggressive action to collect information and force the attacker to reveal his intentions. Defenders aim to negate the attacker's initial advantages, gain freedom of action, and force the enemy to fight on the defender's terms. Once an enemy commits to a course of action, defending forces continue to seek offensive opportunities. They use maneuver and firepower to dictate the tempo of the fight and pre-empt enemy actions.

0462. In support to civil governance operations, initiative contributes to influence over factions. It establishes conditions conducive to political solutions and disrupts illegal activities. Examples of exercising initiative include defusing complicated crises, recognizing and pre-empting inherent dangers before they occur, and resolving grievances before they ignite open hostilities.

0463. To gain and maintain the initiative in support to civil governance operations, commanders develop a comprehensive understanding of the situation and anticipate requirements. Doing these things allows massing of resources to mitigate and prevent the effects of disasters. Commanders can then contribute to relieving suffering, managing consequences, and providing essential services.

Agility

0464. Agility is the ability to move and adjust quickly and easily. It springs from trained and disciplined forces. Agility requires that subordinates act to achieve the commander's intent and fight through any obstacle to accomplish the mission.

0465. Operational agility stems from the capability to deploy and employ forces across the range of Army operations. Army forces and commanders shift among offensive, defensive, and support to civil governance operations as circumstances and missions require. This capability is not merely physical; it requires conceptual sophistication and intellectual flexibility.

0466. Tactical agility is the ability of a friendly force to react faster than the enemy. It is essential to seizing, retaining, and exploiting the initiative. Agility is mental and physical. Agile commanders quickly comprehend unfamiliar situations, creatively apply doctrine, and make timely decisions.

Depth

0467. Depth is the extension of operations in time, space, and resources. Commanders use depth to obtain space for effective maneuver, time to conduct operations, and resources to achieve and exploit success. Depth enables momentum in the offense, elasticity in the defense, and staying power in all operations.

0468. In the offense and defense, depth entails attacking the enemy throughout the AO - simultaneously when possible, sequentially when necessary - to deny him freedom to maneuver. Offensive depth allows commanders to sustain momentum and press the fight. Defensive depth creates opportunities to maneuver against the enemy from multiple directions as attacking forces are exposed or discovered.

0469. In support to civil governance operations, depth extends influence in time, space, purpose, and resources to affect the environment and conditions. ISR combined with IO help commanders understand factional motives, identify power centers, and shape the environment. In support to civil governance operations, depth in resources, planning, and time allows commanders to stop suffering and prevent or slow the spread of disease.

0470. In all operations, staying power - depth of action - comes from adequate resources. Depth of resources in quantity, positioning, and mobility is critical to executing military operations. Commanders balance depth in resources with agility. A large sustainment support (SS) tail can hinder maneuver, but inadequate SS makes the force fragile and vulnerable.

Synchronization

0471. Synchronization is arranging activities in time, space, and purpose to mass maximum relative Army power at a decisive place and time. Without synchronization, there is no massing of effects. Through synchronization, commanders arrange warfighting systems to mass the effects of Army power at the chosen place and time to overwhelm an enemy or dominate the situation. Synchronization is a means, not an end. Commanders balance synchronization against agility and initiative; they never surrender the initiative or miss a decisive opportunity for the sake of synchronization. Synchronization often requires explicit coordination and rehearsals among participants.

Versatility

0472. Versatility is the ability of Army forces to meet the diverse mission requirements of full spectrum operations in various defense mission areas. Competence in a variety of missions and skills allows Army forces to quickly transition from one type of operation to another with minimal changes to the deployed force structure. Versatility depends on adaptive leaders, competent and dedicated soldiers, and well-equipped units. Effective training, high standards, and detailed planning also contribute. Time and resources limit the number of tasks any unit can perform well. Within these constraints, commanders maximize versatility by developing the multiple capabilities of units and soldiers. Versatility contributes to the agility of Army units.

0473. Versatility is a characteristic of multifunctional units. Commanders can take advantage of this by knowing each unit’s capabilities and carefully tailoring forces for each mission. At higher echelons, versatility implies the ability to assume more complex responsibilities.

Chapter V
Battle Command – Command & Control of Full Spectrum Operations

"One of the most important tasks for any leader is to prepare his team and resources for the adventure ahead. Thus, he must focus on the mission plan very carefully, consider the competition and study the industry. By systematically studying every angle of the mission, the leader eventually acquires a holistic perspective of his mission and its environment, as well as all its elements."

Army Tactical Combat Leadership

0501. Command and control (C2) is the exercise of authority and direction by a properly designated commander over assigned and attached forces in the accomplishment of a mission. Commanders perform command and control functions through a command and control system. Command and control is fundamental to the art and science of warfare. Each warfighting function relies on it for integration and synchronization. Command and control uses both art and science. Commanders combine the art of command and the science of control to accomplish missions.

0502. The commander is the focus of command and control. Through it, commanders assess the situation; make decisions; and, direct actions. However, commanders cannot exercise command and control alone except in the smallest organizations. Thus, commanders perform these functions through a command and control system—the arrangement of personnel, information management, procedures, and equipment and facilities essential for the commander to conduct operations. An effective command and control system is essential for commanders to conduct the Operations Process (plan, prepare, execute, and assess) that accomplish the mission decisively.

0503. Trained and disciplined soldiers are the most important element of any command and control system. Their actions and responses - everything from fire and maneuver techniques to the disciplined observation of rules of engagement - are means of controlling operations. Soldiers also assist commanders and exercise control on their behalf. Staffs perform many functions that help commanders exercise command and control. These include:

a. Providing relevant information and analysis.

b. Maintaining running estimates and making recommendations.

c. Preparing plans and orders.

d. Monitoring operations.

e. Controlling operations.

f. Assessing the progress of operations.

Command

0504. Command and control are interrelated. Command is the authority that a commander in the armed forces lawfully exercises over subordinates by virtue of rank or assignment. Command includes the authority and responsibility for effectively using available resources and for planning the employment of, organizing, directing, coordinating, and controlling military forces for the accomplishment of assigned missions. It also includes responsibility for health, welfare, morale, and discipline of assigned personnel. Leaders possessing command authority strive to use it with firmness, care, and skill. The authority of command provides the basis for control.

0505. Command is an individual and personal function. It blends imaginative problem solving, motivational and communications skills, and a thorough understanding of the dynamics of operations. Command during operations requires understanding the complex, dynamic relationships among friendly forces, enemies, and the environment, including the populace. This understanding helps commanders visualize and describe their commander's intent and develop focused planning guidance.

Control

0506. While command is a personal function, control involves the entire force. Control is the regulation of forces and warfighting functions to accomplish the mission in accordance with the commander's intent. It is fundamental to directing operations. Commanders and staffs both exercise control. Aided by staffs, commanders exercise control over all forces in their area of operations. Staffs coordinate actions, keep the commander informed, and exercise control for the commander.

0507. Commanders and staffs must understand the science of control to overcome the physical and procedural constraints under which units operate. Control demands understanding those aspects of operations that can be analyzed and measured. It relies on objectivity, facts, empirical methods, and analysis. These include the physical capabilities and limitations of friendly and enemy organizations and systems. Control also requires a realistic appreciation for time-distance factors and the time required to initiate certain actions. The science of control includes the tactics, techniques, and procedures used to accomplish command and control tasks. It includes operational terms and graphics.

Battle Command

0508. In battle, commanders face a thinking and adaptive enemy. Commanders estimate, but cannot predict, the enemy's actions and the course of future events. Two key concepts for exercising command and control in operations are battle command and mission command. Battle command describes the commander's role in the

operations process. Mission command is the Army's preferred means of battle command.

0509. Battle command is the art and science of understanding, visualizing, describing, directing, leading, and assessing forces to impose the commander's will on a hostile, thinking, and adaptive enemy (See Figure 5.1). Battle command applies leadership to translate decisions into actions - by synchronizing forces and war fighting functions in time, space, and purpose - to accomplish missions. Battle command is guided by professional judgment gained from experience, knowledge, education, intelligence, and intuition. It is driven by commanders. Although obviously it connotes that it is used in combat situations, battle command is also effective in non-combat situations.

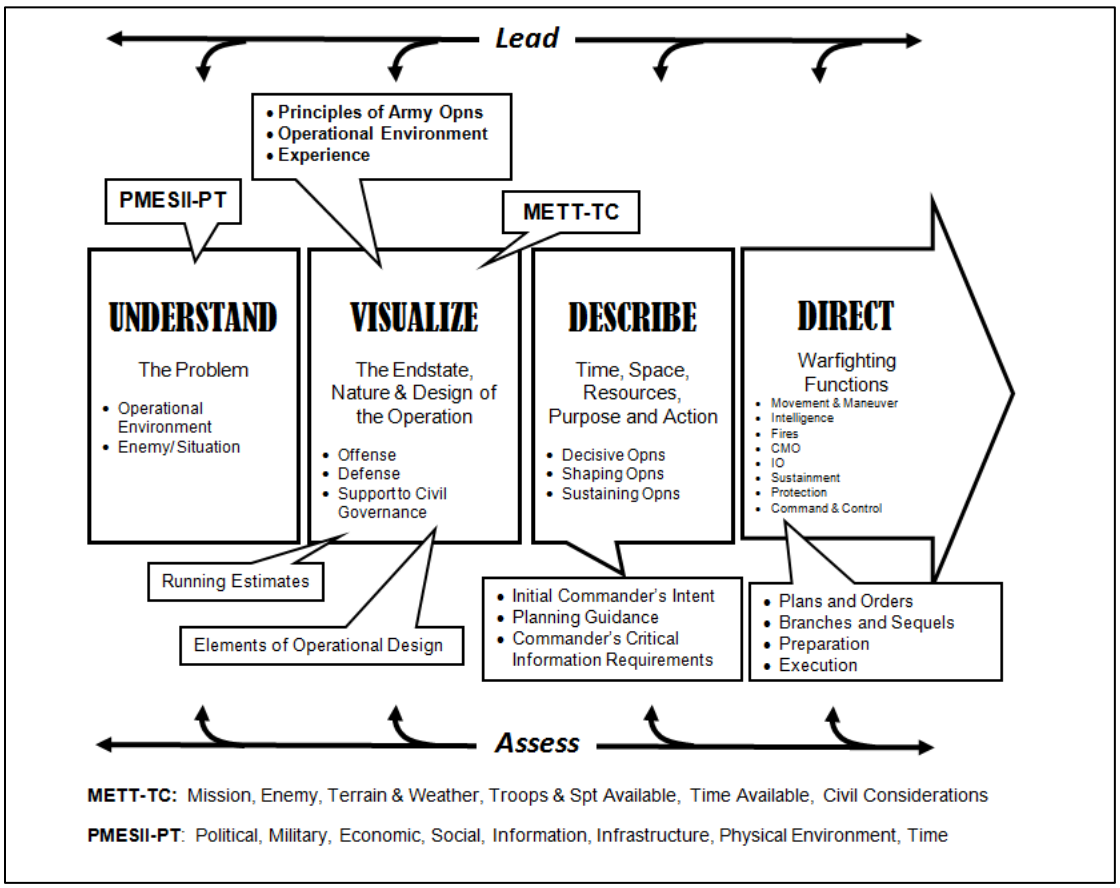

Figure 5.1 - Battle Command

0510. Successful battle command demands timely and effective decisions based on applying judgment to available information. It requires knowing both when and what to decide. It also requires commanders to evaluate the quality of information and knowledge. Commanders identify important information requirements and focus subordinates and the staff on answering them. Commanders are aware that, once executed, the effects of their decisions are frequently irreversible. Therefore, they anticipate actions that follow their decisions.

0511. Commanders continuously combine analytic and intuitive approaches to decision-making to exercise battle command. Analytic decision-making approaches a

problem systematically. The analytic approach aims to produce the *optimal* solution to a problem from among the solutions identified. Commanders must have the mindset that every mission, operation or task is a problem that needs to be solved. The Army's analytic approaches include the Troop Leading Procedure (TLP), the military decision-making process (MDMP) and the Staff Study. The first two approaches apply in field situations while the latter is applied in formal garrison settings.

0512. In contrast, intuitive decision-making is the act of reaching a conclusion that emphasizes pattern recognition based on knowledge, judgment, experience, education, intelligence, boldness, perception, and character. This approach focuses on assessment of the situation vice comparison of multiple options. It relies on the experienced commander's and staff member's intuitive ability to recognize the key elements and implications of a particular problem or situation, reject the impractical, and select an adequate solution.

0513. The two approaches are not mutually exclusive. Commanders may make an intuitive decision based on situational understanding gained during the TLP and MDMP. If time permits, the staff may use a specific MDMP step, such as war-gaming, to validate or refine the commander's intuitive decision. When conducting the MDMP in a time-constrained environment, many techniques - such as selecting a single course of action - rely heavily on intuitive decisions. Even in the most rigorous, analytic decision-making processes, intuition sets boundaries for analysis.

0514. Commanders understand, visualize, describe, direct, lead, and assess throughout the operations process. First, they develop a personal and in-depth understanding of the enemy and operational environment. Then they visualize the desired end state and a broad concept of how to shape the current conditions into the end state. Commanders describe their visualization through the commander's intent, planning guidance, and concept of operations in a way that brings clarity to an uncertain situation. They also express gaps in relevant information as commander's critical information requirements (CCIRs). Direction is implicit in command; commanders direct actions to achieve results and lead forces to mission accomplishment.

0515. Effective battle command requires commanders to continuously assess and lead. Assessment helps commanders better understand current conditions and broadly describe future conditions that define success. They identify the difference between the two and visualize a sequence of actions to link them. Commanders lead by example and personal presence. Leadership inspires soldiers (and sometimes civilians) to accomplish things that they would otherwise avoid. This often requires risk. Commanders anticipate and accept risk to create opportunities to seize, retain, and exploit the initiative and achieve decisive results.

0516. Battle command encourages the leadership and initiative of subordinates through mission command. Commanders accept setbacks that stem from the initiative of subordinates. They understand that land warfare is chaotic and unpredictable and that action is preferable to passivity. They encourage subordinates to accept calculated risks to create opportunities, while providing intent and control that allow for latitude and discretion.

Understand

0517. Understanding is fundamental to battle command. It is essential to the commander's ability to establish the situation's context. Analysis of the enemy and the operational variables provides the information senior commanders use to develop understanding and frame operational problems. To develop a truer understanding of the operational environment, commanders need to circulate throughout their areas of operations as often as possible, talking to the subordinate commanders and soldiers conducting operations, while observing for themselves. These individuals will have a more finely attuned sense of the local situation, and their intuition may cause them to detect trouble or opportunity long before the staff might. This deepens commanders' understanding. It allows them to anticipate potential opportunities and threats, information gaps, and capability shortfalls. Understanding becomes the basis of the commander's visualization.

0518. Numerous factors determine the commander's depth of understanding. These include the commander's education, intellect, experience, and perception. Intelligence, surveillance, and reconnaissance (ISR) is indispensable as is actual observation and listening to subordinates. Formulating CCIRs, keeping them current, determining where to place key personnel, and arranging for liaisons also contribute to understanding. Maintaining understanding is a dynamic ability; a commander's situational understanding changes as an operation progresses. Relevant information fuels understanding and fosters initiative. Greater understanding enables commanders to make better decisions. It allows them to focus their intuition on visualizing the current and future conditions of the environment and describe them to subordinates.

Visualize

Commander's Visualization

0519. Commander's visualization is the mental process of developing situational understanding, determining a desired end state, and envisioning the broad sequence of events by which the force will achieve that end state. It involves discussion and debate between commanders and staffs. During planning, commander's visualization provides the basis for developing plans and orders. During execution, it helps commanders determine if, when, and what to decide as they adapt to changing conditions. Commanders and staffs continuously assess the progress of operations toward the desired end state. They plan to adjust operations as required to accomplish the mission.

0520. Subordinate, supporting, adjacent, and higher commanders communicate with one another to compare perspectives and visualize their environment. Commanders increase the breadth and depth of their visualizations by collaborating with other commanders and developing a shared situational understanding. Likewise, staff input, in the form of running estimates, focuses analysis and detects potential effects on operations. Commanders direct staffs to provide the information necessary to shape their visualization.

0521. Commanders consider the elements of operational design as they frame the problem and describe their visualization. However, the utility and applicability of some elements are often limited at the tactical level. Commanders use the elements that apply to their echelon and situation.

0522. Assignment of a mission provides the focus for developing the commander's visualization. Because military operations are fundamentally dynamic, this visualization must be continuous. Visualizing the desired end state requires commanders to clearly understand the operational environment and analyze the situation in terms of METT-TC (mission, enemy, terrain and weather, troops and support available, time available and civil considerations). This analysis forms the basis of their situational understanding. Commanders consider the current situation and perform a mission analysis that assists in their initial visualization. They continually validate their visualization throughout the operation. To develop their visualization, commanders draw on several sources of knowledge and relevant information. These include:

a. The elements of operational design appropriate to their echelon.

b. Input from the staff and other commanders.

c. Principles of Army Operations.

d. Operational environments and related doctrine.

e. Running estimates.

f. The common operational picture.

g. Their experience and judgment.

h. Subject matter experts.

0523. Visualization allows commanders to develop their intent and planning guidance for the entire operation, not just the initial onset of action.

Mission Variables: The Factors of METTT-TC

0524. METT-TC is a memory aid that identifies the mission variables: **M**ission, **E**nemy, **T**errain and weather, **T**roops and support available, **T**ime available, and **C**ivilconsiderations. It is used in information management (the major categories of relevant information) and in tactics (the major variables considered during mission analysis). Mission analysis describes characteristics of the area of operations in terms of METT-TC, focusing on how they might affect the mission.

a. **Mission**. It is the task, together with the purpose, that clearly indicates the action to be taken and the reason there for. Commanders analyze a mission in terms of specified tasks, implied tasks, and the commander's intent two echelons up. They also consider the missions of adjacent units to understand

their relative contributions to the decisive operation. Results of that analysis yield the essential tasks that - with the purpose of the operation - clearly specify the actions required. This analysis also produces the unit's mission statement - a short description of the task and purpose that clearly indicates the action to be taken and the reason for doing so. It contains the elements of who, what, when, where, and why. Mission command requires that commanders clearly communicate - and subordinates understand - the purpose for conducting an operation or a task.When assigning missions, commanders ensure each subordinate's mission supports the decisive operation and the higher commander's intent. They identify the purpose for each task assigned, nesting unit missions with one another and with the decisive operation. Under mission command, commanders articulate each subordinate's mission in terms that foster the greatest possible freedom of action.

b. **Enemy**. The second variable to consider is the enemy or threat. Relevant information regarding the enemy or threat may include the following: 1) Dispositions (including organization, strength, location, and mobility); 2) Doctrine (or known execution patterns); 3) Personal habits and idiosyncrasies; 4) Equipment, capabilities, and vulnerabilities; 5) Probable courses of action; and, 6) Effects to populations.This analysis includes not only the known enemy but also other threats to mission success. These include threats posed by multiple adversaries with a wide array of political, economic, religious, and personal motivations, or even natural phenomena threatening human life and properties.To visualize threat capabilities and vulnerabilities, commanders require detailed, timely, and accurate intelligence. Of all relevant information, intelligence is the most uncertain. Commanders use ISR to collect the most important threat-related information and process it into intelligence. The intelligence officer synchronizes ISR. The operations officer integrates ISR through the operations process.

c. **Terrain and Weather**. Terrain and weather are natural conditions that profoundly influence operations. Terrain and weather are neutral; they favor neither side unless one is more familiar with - or better prepared to operate in – the physical environment. Terrain includes natural features (such as rivers and mountains) and man-made features (such as cities, airfields, and bridges). Terrain directly affects the selection of objectives and the location, movement, and control of forces. It also influences protective measures and the effectiveness of weapons and other systems. Effective use of terrain reduces the effects of enemy fires, increases the effects of friendly fires, and facilitates surprise. Terrain appreciation - the ability to predict its impact on operations - is an important skill for every leader. For tactical operations, terrain is analyzed using the five military aspects of terrain, expressed in the memory aid, OAKOC: **O**bservation and fields of fire, **A**venues of approach, **K**ey and decisive terrain, **O**bstacles, **C**over and concealment.Climate and weather affect all operations. Climate is the prevailing pattern of temperature, wind velocity, and precipitation in a specific area measured over a period of years. Climate is a more predictable phenomenon than weather. It is also better suited to operational-level analysis. Planners typically focus analysis on how climate affects large-scale operations over a geographically diverse area. In contrast, weather describes the conditions of temperature, wind velocity,

precipitation, and visibility at a specific place and time. It is more applicable to tactical analysis, where its effect on operations is limited in scale and duration. Climate and weather present opportunities and challenges in every operation. They affect conditions and capabilities of soldiers and weapons systems, including mobility, obstacle emplacement times, and munitions performance. Effective commanders use climate and weather to their advantage.

d. **Troops and Support Available**. The fourth mission variable is the number, type, capabilities, and condition of available friendly troops and support. These include resources from joint, interagency, multinational, and private organizations. It also includes support provided by civilians. Commanders and staffs maintain information on friendly forces two echelons down. They track subordinate readiness - including training, maintenance, logistics, and morale. Commanders provide subordinates with the mix of troops and support needed to accomplish their missions. When assigning or allocating troops to subordinates; commanders consider differences in mobility, protection, firepower, equipment, morale, experience, leadership, and training.Commanders consider available troops and support when determining the resources requiredto accomplish a mission - a troop-to-task analysis. If commanders determine they lack sufficient resources, they request additional support. When the resources needed to execute simultaneous operations are not available, commanders execute sequential operations.

e. **Time Available**. Time is critical to all operations. Controlling and exploiting it is central to initiative, tempo, and momentum. By exploiting time, commanders can exert constant pressure, control the relative speed of decisions and actions, and exhaust enemy forces. Upon receipt of a mission, commanders assess the time available for planning, preparing, and executing it. This includes the time required to assemble, deploy, and maneuver units to where they can best mass the effects of Army power. Commanders also consider how much time they can give subordinates to plan and prepare their own operations. Parallel and collaborative planning can help optimize available time. At the operational level, planners consider longer spans of time from the friendly, enemy, and civilian perspectives.Commanders also relate time to the threat and conditions. As part of this analysis, commanders consider time in two contexts: First, they estimate the time available to friendly forces to accomplish the mission relative to enemy efforts to defeat them. Second, they consider the time needed to accomplish their objectives or to change current conditions into those of the desired end state. Analyzing the time available helps commanders determine how quickly and how far in advance to plan operations. The more time the commander and staff take, the more time the enemy has. The time spent perfecting a plan may work to the enemy’s advantage; the additional time provided to enemy forces often offsets the minor gains a slightly improved plan gives friendly forces.Commanders consider the time available relative to the situation. This analysis is essential when success depends on preventing the situation from deteriorating further. Ultimately, good plans executed sooner produce better results than perfect plans executed later.

f. **Civil Considerations**.Understanding the operational environment requires understanding civil considerations. *Civil considerations* reflect how the man-made infrastructure, civilian institutions, and attitudes and activities of the civilian leaders, populations, and organizations within an area of operations influence the conduct of military operations. Commanders and staffs analyze civil considerations in terms of the categories expressed in the memory aid ASCOPE: **A**reas, **S**tructures, **C**apabilities, **O**rganizations, **P**eople, **E**vents.Civil considerations help commanders develop an understanding of the social, political, and cultural variables within the area of operations and how these affect the mission. Understanding the relationship between military operations and civilians, culture, and society is critical to conducting full spectrum operations. These considerations relate directly to the effects of the other instruments of national power. They provide a vital link between actions of forces interacting with the local populace and the desired end state.Civil considerations are essential to developing effective plans for all operations - not just those dominated by support to civil governance operations. Full spectrum operations often involve stabilizing the situation, securing the peace, building local governance capacity, and transitioning authority to civilian control. Combat operations directly affect the populace, infrastructure, and the force's ability to transition to local government authority. The degree to which the populace is expected to support or resist Army forces also affects the design of offensive and defensive operations.Commanders use personal knowledge, area studies, and the intelligence and civil affairs running estimates to assess social, economic, and political factors. Commanders consider how these factors may relate to potential lawlessness, subversion, or insurgency. Their goal is to develop their understanding to the level of cultural astuteness. At this level, they can estimate the effects of friendly actions across the entire set of civil considerations and direct their subordinates with confidence. By increasing their knowledge of the human variables in the operational environment, commanders and staffs improve the force's ability to accomplish its missions. Cultural awareness improves how soldiers interact with the populace and deters their false or unrealistic expectations. They have more knowledge of the society's common practices, perceptions, assumptions, customs, and values, giving better insight into the intent of individuals and groups.

Describe

0525. After commanders visualize an operation, they describe it to their staffs and subordinates to facilitate shared understanding of the mission and intent. Commanders ensure subordinates understand the visualization well enough to begin planning. Commanders describe their visualization in doctrinal terms, refining and clarifying it as circumstances require. Commanders express their initial visualization in terms of:

Initial Commander's Intent

0526. Commanders summarize their visualization in their initial intent statement. The purpose of the initial commander's intent is to facilitate planning while focusing the

overall operations process. Commanders develop this intent statement personally. It is a succinct description of the commander's visualization of the entire operation, a clear statement of what the commander wants to accomplish. The initial commander's intent links the operation's purpose with the conditions that define the desired end state. Usually the intent statement evolves as planning progresses and more information becomes available.

0527. The initial commander's intent statement focuses the staff during the operations process. The staff uses this statement to develop and refine courses of action that contribute to establishing conditions that define the end state. Planning involves developing lines of effort that link the execution of tactical tasks to end state conditions. A clear initial intent statement is essential to this effort.

Planning Guidance

0528. Commanders provide planning guidance with their initial intent statement. Planning guidance conveys the essence of the commander's visualization. Guidance may be broad or detailed, depending on the situation. Effective planning guidance is essentially an initial concept of operations that includes priorities for each warfighting function. It reflects how the commander sees the operation unfolding. It broadly describes when, where, and how the commander intends to employ Army power to accomplish the mission within the higher commander's intent.

0529. Commanders use their experience and judgment to add depth and clarity to their planning guidance. They ensure staffs understand the broad outline of their visualization while allowing the latitude necessary to explore different options. This guidance provides the basis for a detailed concept of operations without dictating the specifics of the final plan. As with their intent, commanders may modify planning guidance based on staff and subordinate input and changing conditions.

Commander's Critical Information Requirements

0530. A commander's critical information requirement is an information requirement identified by the commander as being critical to facilitating timely decision-making. The three key elements are priority intelligence requirements (PIRs), friendly force information requirements (FFIRs) and essential elements of friendly information (EEFIs). A CCIR directly influences decision-making and facilitates the successful execution of military operations. Commanders decide whether to designate an information requirement as a CCIR based on likely decisions and their visualization of the course of the operation. A CCIR may support one or more decisions. During planning, staffs recommend information requirements for commanders to designate as CCIRs. During preparation and execution, they recommend changes to CCIRs based on assessment. A CCIR is:

a. Specified by a commander for a specific operation.

b. Applicable only to the commander who specifies it.

c. Situation dependent - directly linked to a current or future mission.

d. Focused on predictable events or activities.

e. Time-sensitive - the answer to a CCIR must be reported to the commander immediately by any means available.

f. Always promulgated by a plan or order.

0531. Commanders limit the number of CCIRs to focus the efforts of limited collection assets. Typically, commanders identify ten or fewer CCIRs. The fewer the CCIRs, the easier it is for staffs to remember, recognize, and act on each one. This helps staffs and subordinates identify information the commander needs immediately. The staff's first priority is to provide the commander with answers to CCIRs. While most staffs provide relevant information, a good staff expertly distills that information. It identifies answers to CCIRs and gets them to the commander immediately. It also identifies vital information that does not answer a CCIR but that the commander nonetheless needs to know. A good staff develops this acumen through training and experience. Designating too many CCIRs limits the staff's ability to immediately recognize and react to them. Excessive critical items reduce the focus of collection efforts.

0532. The list of CCIRs constantly changes. Commanders add and delete individual requirements throughout an operation based on the information needed for specific decisions. Commanders determine their own CCIRs but may select some from staff nominations. Staff sections recommend the most important intelligence requirements for the commander to designate as CCIRs. Once approved, a CCIR falls into one of following categories:

a. **Priority Intelligence Requirements** -are intelligence requirements stated as a priority for intelligence support that the commander and staff need to understand the adversary or the operational environment. PIRs identify the information about the enemy, terrain and weather, and civil considerations that the commander considers most important. Lessons from recent operations show that intelligence about civil considerations may be as critical as intelligence about the enemy. Thus, all staff sections may recommend information about civil considerations as PIRs. The intelligence officer manages PIRs for the commander.

b. **Friendly Force Information Requirements** - are information the commander and staff need to understand the status of friendly force and supporting capabilities. FFIRs identify the information about the mission, troops and support available, and time available for friendly forces that the commander considers most important. In coordination with the staff, the operations officer manages FFIRs for the commander.

c. **Essential Elements of Friendly Information** - are critical aspects of a friendly operation that, if known by the enemy, would subsequently compromise, lead to failure, or limit success of the operation, and therefore should be protected from enemy detection. An EEFI establishes an element of information to protect rather than one to collect. EEFIs identify those elements of friendly force information that, if compromised, would jeopardize mission

success. EEFIs help commanders protect vital friendly information. Their identification is the first step in the operations security process and central to information protection. EEFIs are also key factors in formulating military deception operations. Operations security, information protection, and military deception all contribute to information superiority.

Direct

Direction

0533. Commanders direct all aspects of operations. This direction takes different forms during planning, preparation, and execution. Commanders make decisions and direct actions based on their situational understanding, which they maintain by continuous assessment. They use control measures to focus the operation on the desired end state. Commanders direct operations by:

a. Preparing and approving plans and orders.

b. Assigning and adjusting missions, tasks, task organization, and control measures based on changing conditions.

c. Positioning units to maximize combat power, anticipate actions, or create or preserve maneuver options.

d. Positioning key leaders to ensure observation and supervision at critical times and places.

e. Adjusting support priorities and allocating resources based on opportunities and threats.

f. Accepting risk to create opportunities to seize, retain, and exploit the initiative.

g. Committing reserves.

h. Changing support arrangements.

Plans and Orders

0534. Plans and orders are key tools used by commanders in directing operations. Under mission command, commanders direct with mission orders. *Mission orders* is a technique for developing orders that emphasizes to subordinates the results to be attained, not how they are to achieve them. It provides maximum freedom of action in determining how to best accomplish assigned missions. Mission orders synchronize subordinates' actions only as required for mission success. Constraints are appropriate when mission success requires closely synchronized action by multiple elements. Even then, commanders establish constraints in a manner that least limits individual initiative.

0535. When close coordination is necessary, commanders limit subordinates' freedom of action with control measures specified in plans and orders. Generally, subordinate commanders exercise full freedom of action within the concept of operations and commander's intent. Higher commanders may impose additional control over subordinates during a particular phase or mission. As soon as conditions allow, subordinates regain their freedom of action. Effective mission orders communicate to subordinates the situation, their commander's mission and intent, and the important tasks of each unit. The commander's intent and concept of operations set guidelines that ensure unity of effort while allowing subordinate commanders to exercise initiative.

Commander's Intent

0536. The commander's intent is a clear, concise statement of what the force must do and the conditions the force must establish with respect to the enemy, terrain, and civil considerations that represent the desired end state. The commander's intent succinctly describes what constitutes success in an operation. It includes the operation's purpose and the conditions that define the end state. It links the mission, concept of operations, and tasks to subordinate units. A clear commander's intent facilitates a shared understanding and focus on the overall conditions that represent mission accomplishment. During execution, the commander's intent spurs individual initiative.

0537. The commander's intent must be easy to remember and clearly understood two echelons down. The shorter the commander's intent, the better it serves these purposes. Typically, the commander's intent statement is three to five sentences long.

0538. Commanders develop their intent statement personally. Commander's intent, coupled with mission, directs subordinates toward mission accomplishment, especially when current orders no longer fit the situation and subordinates must decide how to deviate from them. Subordinates use the commander's intent to orient their efforts and help them make decisions when facing unforeseen opportunities or threats.

Concept of Operations

0539. The concept of operations is a statement that directs the manner in which subordinate units cooperate to accomplish the mission and establishes the sequence of actions the force will use to achieve the end state. It is normally expressed in terms of decisive, shaping, and sustaining operations. The concept of operations expands on the commander's intent by describing how the commander wants the force to accomplish the mission. It states the principal tasks required, the responsible subordinate units, and how the principal tasks complement one another.

0540. The concept of operations promotes general understanding by stating the task (such as attack) that directly accomplishes the mission (the decisive operation) and the units that will execute it. The concept of operations clearly describes the other units' tasks in terms of shaping and sustaining operations. It may include, for example, the type of support or specific location for providing support. Normally, the concept of

operations projects the status of the force at the end of the operation. If the mission dictates a significant change in tasks during the operation, the commander may phase the operation.

0541. Small-unit commanders and leaders usually do not describe their concept of operations in terms of decisive, shaping, and sustaining operations; they simply assign tasks to subordinates using main effort as required

Lead

0542. After commanders make decisions, they guide their forces throughout execution. During execution, commanders must provide the strength of character, moral courage, and will to follow through with their decisions. When changing decisions, they must know when and what to decide, and when to make other decisions that address changes in the situation.

0543. In many instances, a leader's physical presence is necessary to lead effectively. Advanced information systems provide detailed information that facilitates situational understanding and command and control; however, much of the art of command stems from intuition. Commanders carefully consider where they need to be, balancing the need to inspire soldiers with that of maintaining an overall perspective of the entire operation. The commander's forward presence demonstrates a willingness to share danger. It also allows them to appraise for themselves the subordinate unit's condition, including leader and soldier morale. Forward presence allows commanders to sense the human dimension of conflict; particularly when fear and fatigue reduce effectiveness. Commanders need to lead by example, face-to-face with soldiers. Commanders cannot let the perceived advantages of improved information technology compromise their obligation to lead by example.

0544. The commander's will is the one constant element that propels the force through the shock and friction of battle. Friction is inherent in all operations - inevitably, things can and will go wrong. The ability of leaders and soldiers to concentrate erodes as they reach the limit of their endurance. Against a skilled and resolute enemy, soldiers may approach that point when fear, uncertainty, and physical exhaustion dominate their thinking. It is where the commander's strength of will and personal presence must be felt to provide the moral impetus for actions that lead to victory.

Control

0545. Control allows commanders to adjust operations to conform to their commander's intent as conditions change. Staffs provide their greatest support in assisting the commander with control. Commanders use two basic forms of control - procedural and positive. Commanders balance the two based on the situation:

Army Procedural Control

0546. Army Procedural Controlisa technique of regulating forces that relies on a combination of orders, regulations, policies, and doctrine (including tactics, techniques, and procedures). Army procedural control requires no intervention by the higher headquarters once it is established.

Army Positive Control

0547. Army Positive Controlisa technique of regulating forces that involves commanders and leaders actively assessing, deciding, and directing them. It may be restrictive in that commanders directly monitor operations and intervene to direct specific actions to better synchronize subordinates' operations. Excessive use of Army positive control can rapidly become detailed command or micromanagement.

0548. The definitions of individual control measures provide Army procedural control without requiring detailed explanations. For example, boundaries, the most important control measure, designate the area of operations assigned to or by a commander. Commanders know they have full freedom of action within their area of operations.

0549. Army positive control may be appropriate when detailed direction is needed to sequence actions or coordinate the activities of forces close to each other. An example of such a situation is a river crossing. In exercising Army positive control, commanders may use digital information systems to assess without requesting information explicitly or continuously from subordinates. Positive control supplements mission command when necessary.

Control Measures

0550. Commanders exercise Army procedural and Army positive control through control measures. A control measure is a means of regulating forces or warfighting functions. Control measures are established under a commander's authority; however, commanders may authorize staff officers and subordinate leaders to establish them. Commanders may use control measures for several purposes: to assign responsibilities, require synchronization between forces, impose restrictions, or establish guidelines to regulate freedom of action. Control measures are essential to coordinating subordinates' actions. They can be permissive or restrictive. Permissive control measures allow specific actions to occur; restrictive control measures limit the conduct of certain actions.

0551. Control measures help commanders direct by establishing responsibilities and limits that prevent subordinate units' actions from impeding one another. They foster coordination and cooperation between forces without unnecessarily restricting freedom of action. Good control measures foster freedom of action, decision-making, and individual initiative.

0552. Control measures may be detailed (such as a division operation order) or simple (such as a checkpoint). Control measures include but are not limited to:

a. Laws and regulations.

b. Planning guidance.

c. Delegation of authority.

d. Specific instructions to plans and orders and their elements.

e. Commander's intent.

f. Unit missions and tasks.

g. CCIRs.

h. EEFIs.

i. Task organization.

j. Concept of operations.

k. Target lists.

l. Rules of engagement.

m. Service support plans.

n. Graphic control measures.

o. Unit standing operating procedures that control actions such as reporting and battle rhythm.

p. Information requirements.

0553. Certain control measures belong to the commander alone and may not be delegated. These include the commander's intent, unit mission statement, planning guidance, CCIRs, and EEFIs. Unit standing operating procedures specify many control measures. An operation plan or order modifies them and adds additional measures for a specific operation. Commanders, assisted by their staffs, modify control measures to account for the dynamic conditions of operations.

Graphic Control Measures

0554. Some control measures are graphic. A *graphic control measure* is a symbol used on maps and displays to regulate forces and warfighting functions. Graphic control measures are always prescriptive. They include symbols for boundaries, fire support coordination measures, some airspace control measures and minefields. Commanders establish them to regulate maneuver, movement, air space use, fires, and other aspects of operations. In general, all graphic control measures should relate to easily identifiable natural or man-made terrain features.

Common Operational Picture

0555. The common *operational picture* is a single display of relevant information within a commander's area of interest tailored to the user's requirements and based on common data and information shared by more than one command. The availability of a common operational picture facilitates mission command. The common operational picture lets subordinates see the overall operation and their contributions to it as the operation progresses. This knowledge reduces the level of control higher commanders need to exercise over subordinates.

0556. The common operational picture features a scale and level of detail that meets the information needs of that commander and staff. It varies among staff sections and echelons. Separate echelons create a common operational picture by collaborating, sharing, and refining relevant information. To the extent permitted by technology, the common operational picture incorporates as much information from running estimates as possible.

Chapter VI
The Operations Process

"The guy on top must be able to think. The thought or concept has to be formed by the commander himself through his comprehensive appreciation of all the elements and factors affecting his area of command."

LtGen Raul S Urgello

0601. While differing significantly in design and application, all operations follow the operations process. The *operations process* consists of the major command and control activities performed during operations: planning, preparing, executing, and continuously assessing the operation. The commander drives the operations process (See Figure 6.1). These activities may be sequential or simultaneous. They are usually not discrete; they overlap and recur as circumstances demand. Commanders use the operations process to help them decide when and where to make decisions, control operations, and provide command presence.

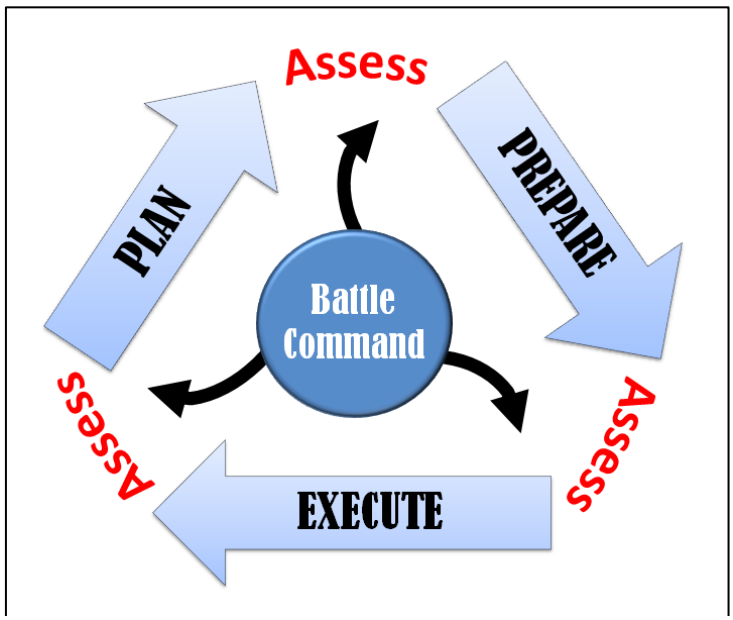

Figure 6.1 - The Operations Process

0602. Throughout the operations process, commanders synchronize forces and warfighting functions to accomplish missions. This synchronization is essential to achieving synergistic effects. It may be needed to achieve any effects at all. For example, delivery of fires must be synchronized with target acquisition to produce the desired effects. However, synchronization is not an end in itself. It is useful only as it contributes to the greater effectiveness of the force. Unnecessary synchronization or synchronization for limited gains degrades tempo, impedes initiative, and allows the enemy to act within the friendly force decision cycle. Excessive synchronization undermines mission command.

0603. Commanders and staffs use the MDMP and troop leading procedures to integrate activities during planning. They also use several other processes and activities to synchronize operations throughout the operations process. Some occur only during preparation or execution; these are listed in the discussions of those activities. Others, the integrating processes and continuing activities, occur during all operations process activities.

Phases of the Operation Process

Assess

0604.*Assessment* is the continuous monitoring and evaluation of the current situation, particularly the enemy, and progress of an operation. Commanders, assisted by their staffs and subordinate commanders, continuously assess the current situation and the progress of the operation and compare it with the concept of operations, mission, and commander's intent. Based on their assessment, commanders direct adjustments, ensuring that the operation remains focused on the mission and commander's intent.

0605. Assessment precedes and guides every operations process activity and concludes each operation or phase of an operation. It involves a comparison of forecasted outcomes to actual events. Assessment entails three tasks:

a. Continuously assessing the enemy's reactions and vulnerabilities.

b. Continuously monitoring the situation and progress of the operation towards the commander's desired end state.

c. Evaluating the operation against measures of performance and measures of effectiveness.

0606. A measure of performance is a criterion used to assess friendly actions that is tied to measuring task accomplishment. Measures of performance answer the question, "Was the task or action performed as the commander intended?" A measure of performance confirms or denies that a task has been properly performed.

0607. A measure of effectiveness is a criterion used to assess changes in system behavior, capability, or operational environment that is tied to measuring the attainment of an end state, achievement of an objective, or creation of an effect. Measures of effectiveness focus on the results or consequences of actions taken. They answer the question, "Is the force doing the right things, or are additional or alternative actions required?" A measure of effectiveness provides a benchmark against which the commander assesses progress toward accomplishing the mission.

0608. Commanders monitor the current situation for unanticipated successes, failures, or enemy actions. As commanders assess the operation, they look for opportunities, threats, and acceptable progress. They accept risks, seize opportunities, and mitigate

threats. Throughout the operation, commanders visualize, describe, and direct changes to the operation.

0609. Staffs analyze the current situation using mission variables, and prepare their running estimates. A running estimate is a staff section's continuous assessment of current and future operations to determine if the current operation is proceeding according to the commander's intent and if future operations are supportable. Staffs continuously assess the impact of new information on the conduct of the operation. They update running estimates and determine if adjustments to the operation are required. Commanders empower their staffs to make adjustments within their areas of expertise. This requires staffs to understand the aspects of operations that require the commander's attention as opposed to those delegated to their control.

0610. Commanders integrate their own assessments and those of subordinate commanders into all aspects of the operations process. Assessment helps commanders refine their situational understanding. It allows them to make informed, rational decisions throughout the entire operation. During planning, assessment focuses on understanding the current conditions in the operational environment and developing relevant courses of action. During preparation and execution, it emphasizes evaluating progress toward the desired end state, determining variances from expectations, and determining the significance (threat or opportunity) of those variances.

0611. The common operational picture, observations of commanders, and running estimates are the primary tools for assessing the operation against the concept of operations, mission, and commander's intent. The commander's visualization forms the basis of the commander's personal decision-making methodology throughout the operation. Running estimates provide information, conclusions, and recommendations from the perspective of each staff section. They help to refine the common operational picture and supplement it with information not readily displayed.

0612. Commanders avoid excessive analysis when assessing operations. Committing valuable time and energy to developing elaborate and time-consuming assessments squanders resources better devoted to other operations process activities. Effective commanders avoid burdening subordinates and staffs with overly detailed assessment and collection tasks. Generally, the echelon at which a specific operation, task, or action is conducted should be the echelon at which it is assessed. This provides a focus for assessment at each echelon. It enhances the efficiency of the overall operations process.

Plan

0613. A plan is a design for a future or anticipated operation. This continuous, evolving framework of anticipated actions guides subordinates through each phase of the operation. A plan is a framework from which to adapt rather than a script to follow. The measure of a good plan is not whether execution transpires as planned but whether the plan facilitates effective action during unforeseen events. Good plans foster initiative, account for uncertainty and friction, and mitigate threats.

0614. Plans come in many forms and vary in scope, complexity, and length of planning horizons. Strategic plans cover the overall conduct of a war. Operational or campaign plans (CAMPLAN) cover a series of related military operations aimed at accomplishing a strategic or operational objective within a given time and space. Tactical plans cover the employment of units in operations, including the ordered arrangement and maneuver of units in relation to each other and to the enemy in order to use their full potential.

0615. An operation plan (OPLAN) is any plan for the preparation, execution, and assessment of military operations. An OPLAN becomes an operations order (OPORD) when the commander sets an execution time.

0617. A service support plan is a plan that provides information and instructions covering service support for an operation. Estimates of the command's operational requirements are the basis for a service support plan. The service support plan becomes a service support order when the commander sets an execution time for the OPLAN that the service support plan supports.

0618. A supporting plan (SUPPLAN) is an operation plan prepared by a supporting commander or a subordinate commander to satisfy the requests or requirements of the supported commander's plan.

0619. A contingency plan (CONPLAN) is a plan for major contingencies that can reasonably be anticipated in the principal geographic sub-areas of the command. Army forces also prepare contingency plans as part of all operations. These contingency plans may take the form of branches or sequels. Operations never proceed exactly as planned. Commanders prepare contingency plans to gain flexibility. Visualizing and planning branches and sequels are important because they involve transitions - changes in mission, type of operation, or forces required for execution. Unless conducted (planned, prepared, executed, and assessed) efficiently, transitions can reduce tempo, slow momentum, and give up the initiative.

0620. A branch plan is a contingency plan or course of action (an option built into the basic plan or course of action) for changing the mission, disposition, orientation, or direction of movement of the force to aid success of the current operation, based on anticipated events, opportunities, or disruptions caused by enemy actions. Army forces prepare branches to exploit success and opportunities, or to counter disruptions caused by enemy actions. Although commanders cannot anticipate every possible threat action, they prepare branches for the most likely ones. Commanders execute branches to rapidly respond to changing conditions most especially if assumptions are proven wrong.

0621. Sequels are operations that follow the current operation. They are future operations that anticipate the possible outcomes - success, failure, or stalemate - of the current operation. A counteroffensive, for example, is a logical sequel to a defense; exploitation and pursuit follow successful attacks. Executing a sequel normally begins another phase of an operation, if not a new operation. Commanders consider sequels early and revisit them throughout an operation. Without such planning during current operations, forces may be poorly positioned for future opportunities, and leaders unprepared to retain the initiative.

0622. Branches and sequels have execution criteria. Commanders carefully review them before execution and update them based on assessment of current operations.

0623. Planning is the process by which commanders (and the staff, if available) translate the commander's visualization into a specific course of action for preparation and execution, focusing on the expected results. Planning begins with analysis and assessment of the conditions in the operational environment, with particular emphasis on the enemy and the situation, to determine the relationships among the mission variables. It involves understanding and framing the problem and envisioning the set of conditions that represent the desired end state. Based on the commander's guidance, planning includes formulating one or more supportable courses of action to accomplish the mission.

0624. Commanders and staffs consider the consequences and implications of each course of action. Once the commander selects a course of action, the staff formulates specified tasks to subordinates, required staff actions, and an assessment framework. Planning develops the detailed information required during execution. Examples include setting initial conditions, assigning command relationships, and establishing priorities. Planning does not cease with the production of a plan or order. It continues throughout an operation, as the order is refined based on changes in the situation. In addition, staffs refine plans for branches and sequels during an operation.

0625. Whenever possible, commanders employ red teams to examine plans from an opponent's perspective. Red teams provide insight into possible flaws in the plan as well as potential reactions by the enemy and other people in the area of operations. This information helps the staff improve the plan and develop more effective branches and sequels.

0626. The scope, complexity, and length of planning horizons differ at the operational and tactical levels. At the operational level, campaign planning coordinates major actions across significant periods. Planners integrate service capabilities with those of joint, interagency, intergovernmental, and multinational organizations. Tactical planning has the same clarity of purpose but typically reflects a shorter planning horizon. Comprehensive, continuous, and adaptive planning characterizes successful operations at both levels.

0627. Army commanders use two doctrinal planning procedures to integrate activities during planning: the MDMP and troop leading procedures. These procedures are based on the scientific problem solving process. As such, commanders and staff must understand that in order to be effective in planning, they must have a problem solving mindset. They must view a mission or task directed by higher headquarters, or those tasks that they see are necessary to retain the initiative, as a problem to be solved.

0628. In units with a formally organized staff, the MDMP provides structure to help commanders and staffs develop estimates, plans, and orders. It provides a logical sequence for decision-making and interaction between the commander and staff, and it provides a common framework for parallel planning. At the lowest tactical echelons, commanders and leaders follow troop leading procedures. Both the MDMP and troop leading procedures hinge on the commander's ability to visualize and

describe the operation. They are means to an end; their inherent value lies in the results achieved, not the process.

0629. Planning continues as necessary during preparation and execution. When circumstances are not suited for the MDMP or troop leading procedures, commanders rely on intuitive decision-making and direct contact with subordinate commanders to integrate activities.

Prepare

0630. Preparation consists of activities performed by units to improve their ability to execute an operation. Preparation includes, but is not limited to: plan refinement; rehearsals; intelligence, surveillance, and reconnaissance; coordination; inspections; and, movement. Preparation creates conditions that improve friendly forces' opportunities for success. It facilitates and sustains transitions, including those of branches and sequels.

0631. Preparation requires staff, unit, and soldier actions. Mission success depends as much on preparation as planning. Rehearsals help staffs, units, and soldiers to better understand their roles in upcoming operations, practice complicated tasks, and ensure equipment and weapons function properly. Activities specific to preparation include:

a. Revising and refining the plan.

b. Rehearsals.

c. Force tailoring and task-organizing.

d. Surveillance and reconnaissance.

e. Training.

f. Troop movements.

g. Pre-combat checks and inspections.

h. Sustainment preparations.

i. Integrating new Soldiers and units.

j. Subordinate confirmation briefs and back briefs.

0632. Several preparation activities begin during planning and continue throughout execution. For example, uncommitted forces prepare for contingencies identified in branches and subsequent events detailed in sequels. Committed units revert to preparation when they reach their objectives, occupy defensive positions, or pass into reserve.

Execute

0633. Execution is putting a plan into action by applying Army power to accomplish the mission and using situational understanding to assess progress and make execution and adjustment decisions. It focuses on concerted action to seize, retain, and exploit the initiative. Army forces seize the initiative immediately and dictate tempo throughout all operations.

0634. Commanders use mission command to achieve maximum flexibility and foster individual initiative. Subordinates exercising their initiative can significantly increase the tempo of operations; however, this may desynchronize the overall operation. De-synchronization may reduce commanders' abilities to mass the effects of Army power. Executing even relatively minor, planned actions produces second and third-order effects throughout the force; these affect the operation's overall synchronization. Nonetheless, under mission command, commanders accept some risk of de-synchronization as the price of seizing, retaining, and exploiting the initiative.

0635. The commander's intent and mission orders focus every echelon on executing the concept of operations. Collaborative synchronization among subordinates is enabled and expected under mission command. It depends on individual initiative to resynchronize the overall operation continuously when subordinates exploit opportunities. Subordinates' successes may offer opportunities anticipated in the concept of operations or develop advantages that make a new concept practical. In either case, the commander's intent keeps the force acceptably focused and synchronized. Subordinates need not wait for top-down synchronization. The climate fostered by mission command encourages subordinates to act on information about the enemy, adversaries, events, and trends without detailed direction.

0636. Commanders assess the situation throughout execution based on information from the common operational picture, running estimates, and subordinate commanders' assessments. When the situation varies from the assumptions on which the order was based, commanders direct adjustments to exploit opportunities and counter threats. Possible adjustments include initiating a new phase of the operation, modifying the concept of operations or executing a branch plan altogether.

0637. Staffs help commanders control the integrating processes and continuing activities during execution. In addition, commanders, assisted by their staffs, perform the following activities specific to execution:

a. Focus assets on the decisive operation.

b. Adjust CCIRs and EEFIs based on the situation.

c. Adjust control measures.

d. Manage movement and positioning of supporting units.

e. Adjust unit missions and tasks as necessary.

f. Modify the concept of operations as required.

g. Position or relocate committed, supporting, and reserve units.

0638. As commanders assess the operation, they determine when decisions are required. Orders usually identify some decision points. However, unanticipated enemy actions or conditions often present situations that require unanticipated decisions. Commanders act when decisions are required. They do not wait for a set time in the battle rhythm.

0639. During execution, commanders rely more on intuitive than on analytic decision-making. Commanders draw on experience, intellect, creativity, intuition, and education to make rapid decisions. They learn deliberately as the situation develops and make changes based on that learning. Staffs must synchronize or resynchronize forces and warfighting functions faster during execution than during planning and preparation. They must do this while forces are moving and processes are ongoing.

0640. Commanders do not restrict their visualization to the current operation. As their situational understanding evolves, commanders incorporate considerations for the operation's next phase or sequel into their visualization. They begin to visualize how to transition from the current operation to the next one. Based on their visualization; commanders, direct actions to posture the force for the transition. As they visualize the implications of events and their solutions, commanders describe their conclusions to staff and subordinates through updated CCIRs and planning guidance. The guidance may be to develop a branch or change the main effort to exploit success. Commanders direct adjustments when necessary, primarily through fragmentary orders.

Integrating Processes and Continuing Activities

0641. Commanders use integrating processes and continuing activities to synchronize operations during all operations process activities. Figure 6.2 illustrates how the integrating processes and continuing activities last throughout the operations process. Battle rhythm is a key control measure for managing integration.

Integrating Processes

0642. Certain integrating processes occur during all operations process activities. They must be synchronized with each other as well as integrated into the overall operation:

a. Intelligence Preparation of the Operational Environment (IPOE).

b. Targeting.

c. ISR Synchronization.

d. Composite Risk management.

e. Knowledge Management.

Continuing Activities

0643. The following activities continue during all operations process activities. They are synchronized with one another and integrated into the overall operation:

a. Intelligence, Surveillance, and Reconnaissance.

b. Security Operations.

c. Protection.

d. Liaison and Coordination.

e. Terrain Management.

f. Information Management.

g. Airspace Command and Control

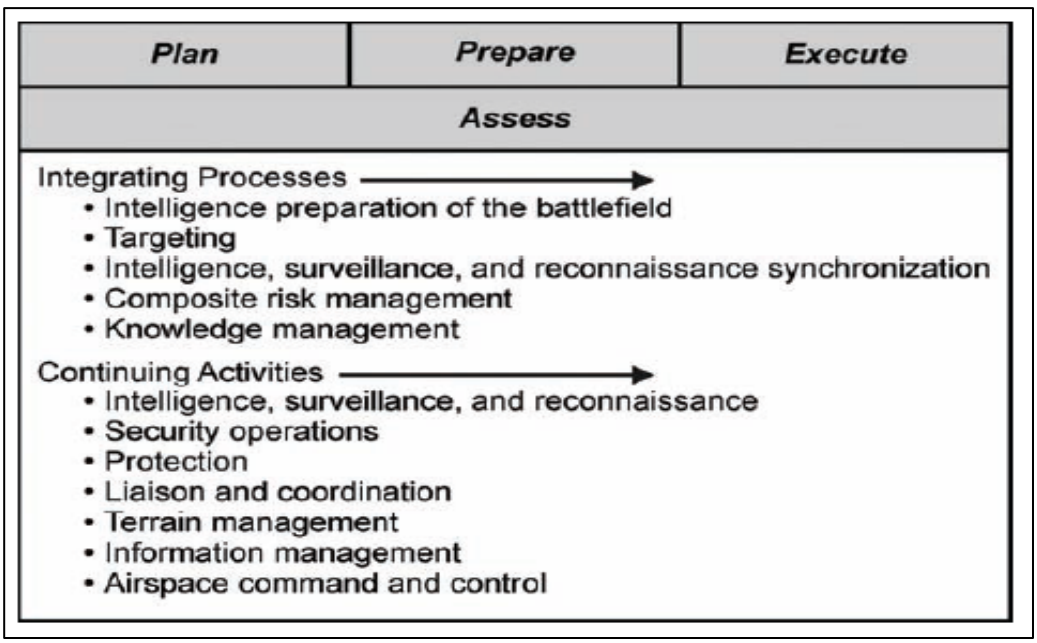

Figure 6.2 - Integrating Processes and Continuing Activities along the Operations Process

Chapter VII
Operational Art

"The first, the supreme, the most far-reaching act of judgment that the statesman and commander have to make is to establish…the kind of war on which they are embarking; neither mistaking it for, nor trying to turn it into, something that is alien to its nature. This is the first of all strategic questions and the most comprehensive."

Carl von Clausewitz
On War

0701. Operational Art represents the creative aspect of operational level command. It is the expression of informed vision across the levels of war. Operational design is a bridge between the strategic end state and the execution of tactical tasks. The elements of operational design help operational commanders clarify and refine their concept of operations by providing a framework to describe operations.

Understanding Operational Art

0702. Military operations require integrating creative vision across the levels of war. Military art pervades operations at all echelons. Although military art transcends the levels of war, operational art is distinct. Operational art is the application of creative imagination by commanders and staffs - supported by their skill, knowledge, and experience - to design strategies, campaigns, and major operations and organize and employ military forces. Operational art integrates ends, ways, and means across the levels of war. It is applied only at the operational level.

0703. Operational art reflects an intuitive understanding of the operational environment and the approach necessary to establish conditions for lasting success. In visualizing a campaign or major operation, operational commanders determine which conditions satisfy the President's strategic guidance; taken together, these conditions become the end state. Commanders devise and execute plans that complement the actions of the other instruments of national power in a focused, unified effort. To this end, operational commanders draw on experience, education, intellect, intuition, and creativity. (See Figure 7.1)

0704. The Levels of Army Operations (Section 2-9) define and clarify the relationship between strategy, operational approach, and tactical actions. The levels have no finite limits or boundaries. They correlate with specific levels of responsibility and planning. They help organize thought and approaches to a problem. The levels clearly distinguish between headquarters and the specific responsibilities and actions performed at each echelon. Despite advances in technology, digital information sharing, and the increased visibility of tactical actions, the levels of war remain useful. Decisions at one level always affect other levels.

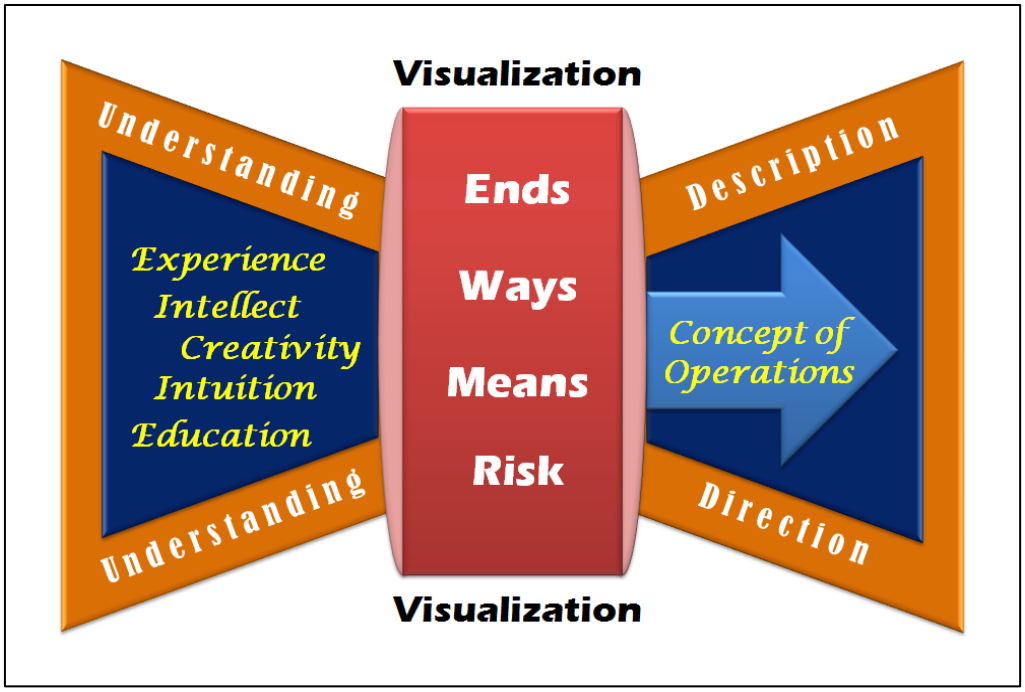

Figure 7.1 - Operational Art

0705. A natural tension exists between the levels of army operations and echelons of command. This tension stems from different perspectives, requirements, and constraints associated with command at each level of war. Between the levels of army operations, the horizons for planning, preparation, and execution differ greatly. Operation-level commanders typically orchestrate the activities of military and other governmental organizations across large areas. Tactical commanders focus primarily on employing combined arms within an area of operations. They may work with civilian agencies, but political, informational, and economic issues may not be as important at the tactical level. In many situations, tactical commanders receive missions that divert Army power from tasks that seem more urgent at lower levels. It is a commander's responsibility to recognize and resolve this tension.

0706. A string of tactical victories does not guarantee success at the operational and strategic levels. Tactical success, while required to set operational conditions, must be tied to attaining the strategic end state. Wars are won at the operational and strategic levels; yet without tactical success, a major operation cannot achieve the desired end state. Commanders overcome this tension through open and continuous dialog, a thorough understanding of the situation across the levels of army operations, and a shared vision that integrates and synchronizes actions among the echelons of command.

0707. Individuals, crews, and small units act at the tactical level. At times, their actions may produce strategic or operational effects. However, this does not mean these elements are acting at the strategic or operational level. Actions are not strategic unless they contribute directly to achieving the strategic end state. Similarly, actions are considered operational only if they are directly related to operational movement or the sequencing of battles and engagements. The level at which an action occurs is

determined by the perspective of the echelon in terms of planning, preparation, and execution.

0708. Strategy is a prudent idea or set of ideas for employing the instruments of national power in a synchronized and integrated fashion to achieve theater, national, and/or multinational objectives. The President translates national interests and policy into a national strategic end state. Unified commanders base their regional strategic planning on this end state. To ensure their military strategy is consistent with national interests and policy, unified commanders participate in strategic discourse with the President, Secretary of Defense, the Chief of Staff, AFP and multinational partners in some cases. Strategy involves more than campaigns and major operations. When successful, these plans promote national or multinational goals through peaceful processes.

0709. National interests and policy define and inform military strategy. They provide a broad framework for conducting military operations. Thus, military strategies for the different defense mission areas (operational environments) implement national policy and strategy. Successful commanders understand the relationship and links between policy and strategy. They also appreciate the distinctions and interrelationships among the levels of army operations. This appreciation is fundamental to an informed understanding of the decisions and actions at each level. Without it, commanders cannot sequence and synchronize military and non-military actions toward an end state consistent with national strategy and policy.

0710. The operational level links employing tactical forces to achieving the strategic end state. At the operational level, commanders conduct campaigns and major operations to establish conditions that define that end state. These actions are conducted simultaneously or sequentially in accordance with a common plan and are controlled by a single commander. Major operations are not solely the purview of combat forces. They are typically conducted with the other instruments of national power. Major operations often bring together the capabilities of other agencies, nations, and organizations. For noncombat operations, a major operation refers to the relative size and scope of a military operation.

0711. Operational art determines when, where, and for what purpose commanders employ major forces. Operational commanders position and maneuver forces to shape conditions in their area of operations for their decisive operation. Commanders exploit tactical victories to gain strategic advantage or reverse the strategic effects of tactical losses.

0712. Actions at the operational level usually involve broader dimensions of time and space than tactical actions do. Operational commanders need to understand the complexities of the operational environment, look beyond the immediate situation, and consider the consequences of their approach and subordinates' actions. Operational commanders seek to create the most favorable conditions possible for subordinate commanders by shaping future events.

0713. Experienced operational commanders understand tactical realities and can create conditions that favor tactical success. Likewise, good tactical commanders understand the operational and strategic context within which they execute their

assigned tasks. This understanding helps them seize opportunities (both foreseen and unforeseen) that contribute to establishing the end state or defeating enemy initiatives that threaten its achievement. Operational commanders require experience at both the operational and tactical levels. This experience gives them the knowledge and intuition needed to understand how tactical and operational possibilities interrelate.

0714. For any tactical-level operation, the surest measure of success is its contribution to achieving the end state conditions. Commanders avoid battles and engagements that do not contribute to achieving the operational end state conditions.

Applying Operational Art

0715. Commanders use operational art to envision how to create conditions that define the national strategic end state. Actions and interactions across the levels of army operations influence these conditions. These conditions are fundamentally dynamic and linked together by the human dimension, the most unpredictable and uncertain element of conflict. Any operational environment is complex, adaptive, and interactive. Through operational art, commanders apply a comprehensive understanding of such skill to determine the most effective and efficient methods to influence conditions in various locations across multiple echelons.

0716. Operational art spans a continuum - from comprehensive strategic direction to concrete tactical actions. Bridging this continuum requires creative vision coupled with broad experience and knowledge. Operational art provides a means for commanders to derive the essence of an operation. Without it, tactical actions devolve into a series of disconnected engagements, with relative attrition as the only measure of success. Through operational art, commanders translate their concept of operations into an operational design and ultimately into tactical tasks. They do this by integrating ends, ways, and means and by envisioning dynamic combinations of the elements of full spectrum operations across the levels of war. They then apply operational art to array forces and maneuver them to achieve the desired end state. (See Figure 7.2)

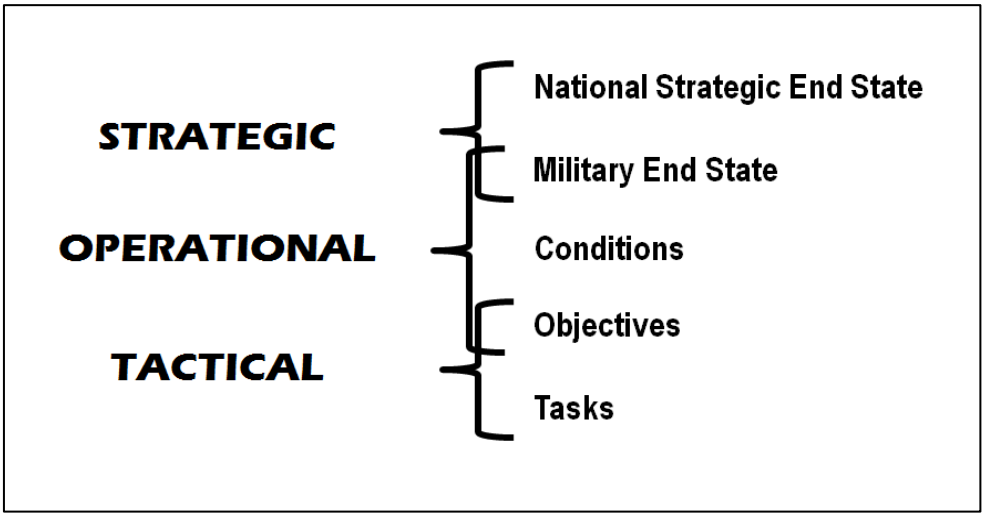

Figure 7.2 - Relating Tactical Tasks to the Strategic End State.

0717. Every operation begins with a commander's intent that guides its conduct. In almost all cases, an operational commander's intent and concept of operations envision all the instruments of national power working toward a common end state. Through operational art, commanders frame their concept by answering several fundamental questions:

a. What is the force trying to accomplish (ends)?

b. What conditions, when established, constitute the desired end state (ends)?

c. How will the force achieve the end state (ways)?

d. What sequence of actions is most likely to attain these conditions (ways)?

e. What resources are required, and how can they be applied to accomplish that sequence of actions (means)?

f. What risks are associated with that sequence of actions, and how can they be mitigated (risk)?

0718. Operational art is generally the purview of joint force commanders. Joint force commanders visualize, describe, and direct all aspects of campaigns. This is particularly true when translating broad national interests and policy into a clearly defined, decisive, and attainable end state and its supporting military conditions. These conditions describe how joint force commanders visualize the state of their operational area upon achieving that end state. Based on a comprehensive analysis of the operational environment, joint force commanders determine the centers of gravity around which to frame the campaign.

0719. Army component commanders are not directly responsible for defining the military end state. Nonetheless, their participation in the initial stages of campaign design is vital. When designing major operations within a campaign, Army component commanders formulate activities at the operational level of war. These Army operations heavily influence campaign design because of their complexity, duration, risk, and importance. Typically, military forces directly, routinely, and persistently interact with the populace only in the land domain. Therefore, the land domain is where joint force commanders integrate most capabilities of the other instruments of national power. By introducing the land perspective into the collaborative effort, senior commanders provide joint force commanders with a broader understanding of Army forces' capabilities and limitations. In turn, Army force commanders visualize and describe their design of major land operations with a clear understanding of the joint design. This collaboration forms the basis for conducting interdependent joint operations.

0720. When applying operational art, collaboration informs situational understanding. This collaboration involves an open, continuous dialog between commanders that spans the levels of army operations and echelons of command. This dialog is essential to reducing the tension inherent to command and control across the levels of army operations. It is vital in establishing a common perspective on the problem and a

shared understanding of the operational environment's conditions. This collaboration ensures that the strategic end state remains linked to operational capabilities. It establishes not only what is possible but also what is practical at the operational level. Effective collaboration enables assessment, fosters critical analysis, and anticipates adaptation. It assumes that the strategic end state is not fixed. Collaboration allows operational commanders to recognize and react to changes in the situation. Operational commanders can then adjust operations so tactical actions remain linked to conditions in the operational environment.

0721. Practicing operational art requires a broad understanding of the operational environment at all levels. It also requires practical creativity and the ability to visualize changes in the operational environment. Operational commanders need to project their visualization beyond the realm of physical combat. They must anticipate the operational environment's evolving military and non-military conditions. Operational art encompasses visualizing the synchronized arrangement and employment of military forces and capabilities to achieve the strategic or operational end state. This creative process requires the ability to discern the conditions required for victory before committing forces to action.

0722. Balancing the factors of time, space, and force against a set of conditions is more difficult for operational commanders than for tactical commanders. These factors are usually fixed at the tactical level. At the operational level, the situation is more complex; non-military aspects of the situation dominate and present intangible elements increasingly difficult to quantify. The greater the strategic end state's scope, the more uncertain the situation facing operational commanders.

0723. Conflict is fundamentally a human endeavor. It is characterized by violence, uncertainty, chance, and friction. Land operations are inherently tied to the human dimension; they cannot be reduced to a simple formula or checklist. Operational art helps commanders integrate diverse capabilities, including those related to the human dimension. It also helps synchronize military actions with actions of other instruments of national power. Operational art provides the conceptual framework for ordering thought when designing operations. It is the creative engine that drives commanders' ability to seize, retain, and exploit initiative and achieve decisive results.

The Elements of Operational Design

0724. Operational Design is the conception and construction of the framework that underpins a campaign or major operation plan and its subsequent execution. Through operational art, commanders and staffs develop a broad concept for applying the military instrument, including Army power, and translate it into a coherent, feasible design for employing joint or Army only forces. This operational design provides a framework that relates tactical tasks to the strategic end state. It provides a unifying purpose and focus to all operations.

0725. In applying operational art, commanders consider the elements of operational design. These are tools to help clarify and refine their concept of operations by providing a framework to describe its execution. They help commanders understand,

visualize, and describe complex combinations of Army power and help them formulate their intent and guidance. The elements of operational design may be used selectively in any operation. However, their application is broadest in the context of campaigns and major operations.

0726. The elements of operational design are essential to identifying tasks and objectives that tie tactical missions to achieving the strategic end state. They help refine and focus the concept of operations that forms the basis for developing a detailed plan or order. During execution, commanders and staffs consider the design elements as they assess the situation. They adjust current and future operations and plans as the operation unfolds.

0727. Commanders and staffs gauge how the elements of operational design relate to the mission variables. The applicability of individual elements varies with echelon. Generally, all apply at the strategic and operational levels. Some have no tactical relevance whatsoever. For example, Army component commanders translate operational reach and the culminating point into a broad design for operational maneuver; decisive points become objectives along lines of operations and lines of effort. In contrast, leaders at lower tactical echelons may only consider objectives. Ultimately, commanders at each echelon determine which elements are relevant, based on the mission and conditions.

0728. Operational art requires three continuous, cyclic activities. (See Figure 7.3)These activities define military and non-military actions across the spectrum of conflict:

a. Framing (and reframing) the problem.

b. Formulating the design.

c. Refining the design.

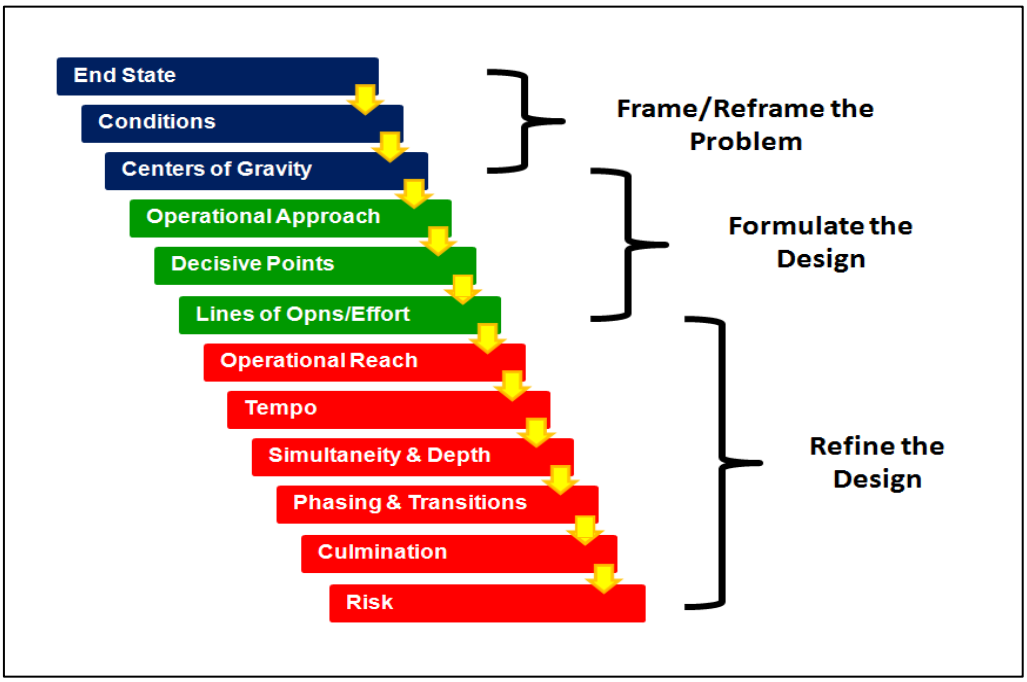

Figure 7.3 - Linking the Elements of Operational Design

0729. Individually, these activities further refine the nature of the operation, determine force structure, focus operations, and prioritize resources. Together, they help operational commanders translate broad political guidance into tangible tactical actions. The elements of operational design help commanders develop planning guidance and communicate their intent. These actions are the first steps in setting the conditions for operational and tactical success.

Framing the Problem

0730. Framing (and reframing) the problem encompasses receiving and clarifying the strategic end state and conditions. It also includes determining the appropriate operating environments, operational approach, and defeat or stability mechanisms. Framing requires understanding and viewing the operational environment from a systemic perspective and identifying and analyzing centers of gravity. Collaboration informs problem framing.

End State and Conditions

0731. At the national strategic level, the end state is represented by the broadly expressed conditions that the President wants to exist when a campaign or major operation ends. The end state is thus an image of the operational environment consistent with national interests and policy. The strategic end state is achieved through the integrated, collective activities of all instruments of national power, not by any single instrument applied in isolation.

0732. Exercising battle command at all levels requires understanding the operational environment's conditions. Clearly describing the end state requires understanding the operational environment and operational approach, and assessing the environment's friendly, enemy, adversary, and neutral aspects. Commanders include it in their planning guidance and commander's intent. A clearly defined end state promotes unity of effort, facilitates integration and synchronization, and helps mitigate risk.

0733. Based on the strategic end state, commanders determine the conditions that compose the supporting military end state. Army operations typically focus on attaining the military end state. However, Army operations also contribute to establishing non-military conditions. Sometimes that is their focus. Operational level commanders explicitly describe the end state and its defining conditions for every operation. Otherwise, the necessary integration between tactical tasks and operational conditions does not occur. Missions become vague and operations lose focus. Every operation should be directed toward a clearly defined, decisive, and attainable end state.

0734. The end state may evolve as a campaign progresses. Strategic and operational guidance may be refined, the operational environment's conditions might change, and situational understanding may increase. Therefore, all commanders continuously monitor operations and evaluate their progress. Operational commanders assess progress against measures of effectiveness and the end state conditions. These

conditions form the basis for decisions that ensure operations progress consistently toward the desired end state.

Centers of Gravity

0735. A *center of gravity* is the source of power that provides moral or physical strength, freedom of action, or will to act. This definition states in modern terms the classic description offered by Clausewitz: "the hub of all power and movement, on which everything depends." The loss of a center of gravity ultimately results in defeat. The center of gravity is a vital analytical tool for designing campaigns and major operations. It provides a focal point for them, identifying sources of strength and weakness at the strategic and operational levels of war.

0736. Modern understanding of the center of gravity has evolved beyond the term's preindustrial definition. Centers of gravity are now part of a more complex perspective of the operational environment. Today they are not limited to military forces and can be either physical or moral. Physical centers of gravity, such as a capital city or military force, are typically easier to identify, assess, and target. They can often be influenced solely by military means. In contrast, moral centers of gravity are intangible and complex. They are dynamic and related to human factors. Examples include a charismatic leader, powerful ruling elite, religious tradition, tribal influence, or strong-willed populace. Military means alone are usually ineffective when targeting moral centers of gravity. Eliminating them requires the collective, integrated efforts of all instruments of national power.

0737. Typically, a single enemy center of gravity, and a single friendly center of gravity exist at the strategic and operational levels of war for a given campaign or major operation. However, in some campaigns, none exist below the strategic level; in others, there may be more than a single friendly or enemy center of gravity. Centers of gravity are not relevant at the tactical level; the tactical equivalent is the decisive point. At the strategic level, the center of gravity may be vulnerable to an operational-level approach; at the operational level, the center of gravity may be vulnerable to tactical actions. The enemy may shift a center of gravity to protect and sustain a source of power. Similarly, changes in the operational environment may cause centers of gravity to shift. Therefore, analysis of friendly and enemy centers of gravity begins during planning and continues throughout a campaign or major operation.

0738. Center of gravity analysis is thorough and detailed. Faulty conclusions drawn from hasty or abbreviated analyses can adversely affect operations, waste critical resources, and incur undue risk. A thorough understanding of the operational environment facilitates identifying and targeting enemy centers of gravity. This understanding encompasses how enemies and adversaries organize, fight, and make decisions. It also includes their physical and moral strengths and weaknesses. In addition, commanders should understand how military forces interact with the other operational variables. This understanding helps planners identify centers of gravity, their associated decisive points, and the best operational approach for isolating, neutralizing, and defeating them. In some support to civil governance operations, centers of gravity are generally moral and can be best addressed in conjunction with other instruments of national power.

0739. Thorough and detailed analyses help commanders and staffs understand the operational environment's complex nature. From this understanding, they determine the actions necessary to achieve the desired end state. As sources of power, centers of gravity are inherently complex. Commanders and staffs examine them systemically to determine the relationships between the conditions and resources that enable each one to function. Understanding the dynamic, complex nature of a center of gravity is the key to exposing its vulnerabilities. Commanders and staffs identify vulnerabilities that expose enemy centers of gravity to paralysis, shock, and collapse. Friendly forces can then attack those vulnerabilities and set conditions for success.

0740. As a default approach to center of gravity analysis, Army commanders and staffs use the Center of Gravity (CG) – Critical Capabilities (CC) – Critical Requirements (CR) – Critical Vulnerabilities (CV) construct – these are referred to as critical factors (See Figure 7.4). As these critical factors are determined at the strategic and operational levels, they are translated to decisive points that will be assigned to tactical units for action. Logically, centers of gravity – both at the strategic and operational levels – are addressed by neutralizing critical capabilities, denying critical requirements and exploiting critical vulnerabilities. On the other hand, friendly centers of gravity, which are also existent at the strategic and operational levels, provide the basis for protecting the force.

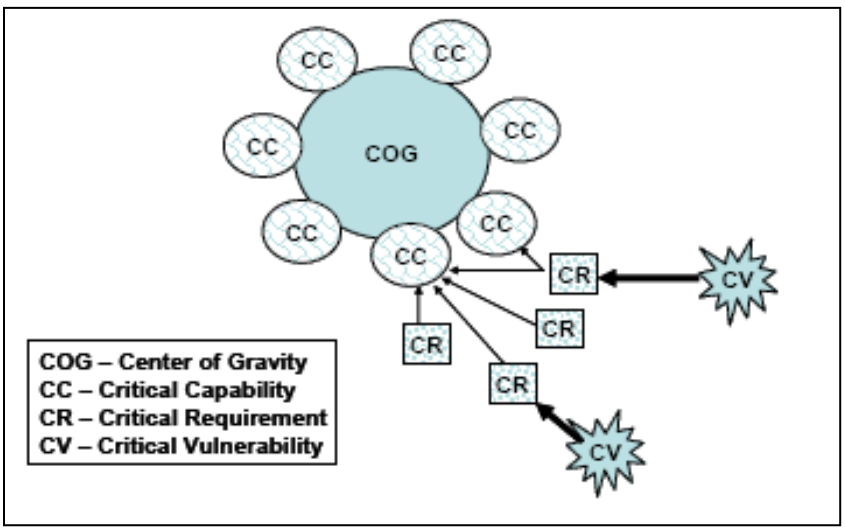

Figure 7.4 - The CG-CC-CR-CV Approach to COG Analysis

Formulating the Design

0741. Formulating the design builds on the framework developed previously. It continues the analysis of centers of gravity and explores the nature of the enemy or adversary by:

a. Determining the appropriate operational approach.

b. Identifying decisive points.

c. Devising lines of operations and effort.

d. Determining the operational approach that includes identifying the defeat or stability mechanisms that best accomplish the mission.

e. Selecting the decisive points that offer the greatest leverage against centers of gravity.

f. Determining the combination of lines of operations and effort that best translate the concept of operations into specific tactical tasks.

Operational Approach

0742. The operational approach is the manner in which a commander contends with a center of gravity. There are two operational approaches: direct and indirect (See Figure 7.5). The direct approach attacks the enemy's center of gravity or principal strength by applying Army power directly against it. However, centers of gravity are generally well protected and not vulnerable to a direct approach. Thus, commanders usually choose an indirect approach. The indirect approach attacks the enemy's center of gravity by applying Army power against a series of decisive points while avoiding enemy strength. Both approaches use unique combinations of defeat or stability mechanisms, depending on the mission. Whether direct or indirect, an effective operational approach achieves decisive results through combinations of defeat and stability mechanisms. As commanders and staffs frame the problem, they determine the appropriate combination of defeat or stability mechanisms to solve it. This begins the process that ends with the design for an operation that achieves the desired end state.

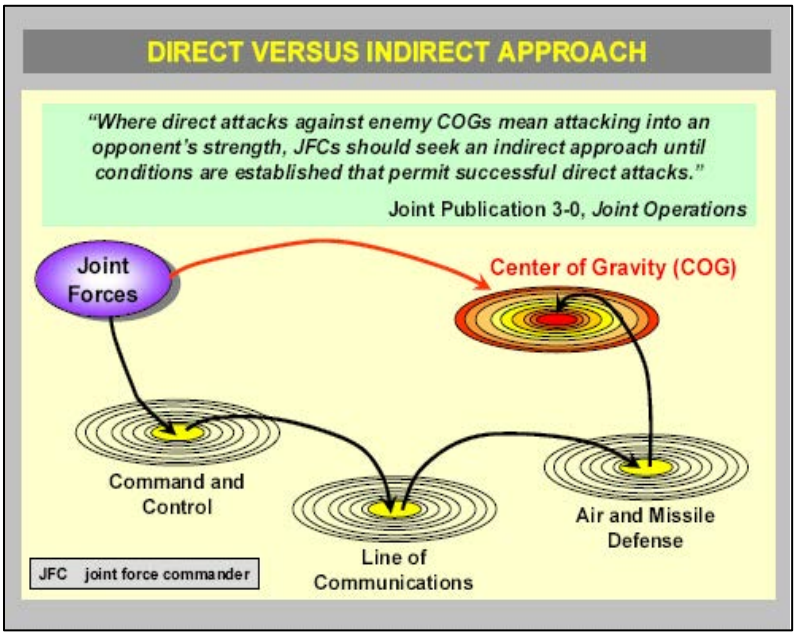

Figure 7.5 - Operational Approach

0743. **Defeat Mechanism**. A defeat mechanism is the method through which friendly forces accomplish their mission against enemy opposition. A defeat mechanism is

described in terms of the physical or psychological effects it produces. Defeat mechanisms are not tactical missions; rather, they describe broad operational and tactical effects. Commanders must translate these effects into tactical tasks. Operational art formulates the most effective and efficient way to defeat enemy aims. Physical defeat deprives enemy forces of the ability to achieve those aims; psychological defeat deprives them of the will to do so. Army forces are most successful when applying focused combinations of defeat mechanisms. This produces complementary and reinforcing effects not attainable with a single mechanism. Used individually, a defeat mechanism achieves results proportional to the effort expended. Used in combination, the effects are likely to be both synergistic and lasting. Army forces at all echelons use combinations of four defeat mechanisms:

a. Destroy.

b. Dislocate.

c. Disintegrate.

d. Isolate.

0744. Destroy means to apply lethal combat power on an enemy capability so that it can no longer perform any function and cannot be restored to a usable condition without being entirely rebuilt. The most effective way to destroy enemy capabilities is with a single, decisive attack. When the necessary Army power cannot be massed simultaneously, commanders apply it sequentially. This approach is called attrition. It defeats the enemy by maintaining the highest possible rate of destruction over time. Destruction may not force the enemy to surrender; well-disciplined forces and those able to reconstitute can often endure heavy losses without giving up. Defeat cannot be accurately measured solely in terms of destruction. This is particularly true when criteria focus on narrow metrics, such as casualties, equipment destroyed, or perceived enemy strength. Destruction is especially difficult to assess if friendly forces apply force indiscriminately. The effects of destruction are often transitory unless combined with isolation and dislocation.

0745. Dislocate means to employ forces to obtain significant positional advantage, rendering the enemy's dispositions less valuable, perhaps even irrelevant. It aims to make the enemy expose forces by reacting to the dislocating action. Dislocation requires enemy commanders to make a choice: accept neutralization of part of their force or risk its destruction while repositioning. Turning movements and envelopments produce dislocation. When combined with destruction, dislocation can contribute to rapid success.

0746. Disintegrate means to disrupt the enemy's command and control system, degrading the ability to conduct operations while leading to a rapid collapse of the enemy's capabilities or will to fight. It exploits the effects of dislocation and destruction to shatter the enemy's coherence. Typically, disintegration follows the loss of capabilities that enemy commanders use to develop and maintain situational understanding, coupled with destruction and dislocation. Simultaneous operations produce the strongest disintegrative effects. Disintegration is difficult to achieve; however, prolonged isolation, destruction, and dislocation can produce it.

0747. Isolate means to deny an enemy or adversary access to capabilities that enable the exercise of coercion, influence, potential advantage, and freedom of action. Isolation limits the enemy's ability to conduct operations effectively by marginalizing one or more of these capabilities. It exposes the enemy to continued degradation through the massed effects of the other defeat mechanisms. There are two types of isolation:

a. Physical isolation, which is difficult to achieve, but easier to assess. An isolated enemy loses freedom of movement and access to support.

b. Psychological isolation, which, while difficult to assess, is a vital enabler of disintegration. The most important indicators include the breakdown of enemy morale and the alienation of a population from the enemy.

0748. Isolation alone rarely defeats an enemy. However, it complements and reinforces other defeat mechanisms' effects. Offensive operations often focus on destroying personnel and equipment. They may use maneuver to dislocate forces. However, these effects multiply when combined with isolating the enemy from sources of physical and moral support.

0749. **Stability Mechanisms**. Commanders use stability mechanisms to visualize how to employ the support to civil governance element of full spectrum operations. A stability mechanism is the primary method through which friendly forces affect civilians in order to attain conditions that support establishing a lasting, stable peace. As with defeat mechanisms, combinations of stability mechanisms produce complementary and reinforcing effects that accomplish the mission more effectively and efficiently than single mechanisms do alone. The four stability mechanisms are:

a. Compel

b. Control

c. Influence

d. Support

0750. Compel means to use, or threaten to use, lethal force to establish control and dominance, effect behavioral change, or enforce compliance with mandates, agreements, or civil authority. The appropriate and discriminate use of lethal force reinforces efforts to stabilize a situation, gain consent, or assure compliance. Conversely, misusing force can adversely affect an operation's legitimacy. Legitimacy is essential to producing effective compliance. Compliance depends on how the local populace and others perceive the force's ability to exercise lethal force to accomplish the mission.

0751. Control means to impose civil order. It includes securing communities, routes, sensitive sites, population centers, and individuals. It also involves physically occupying key terrain and facilities. Control includes activities related to disarmament, demobilization, and reintegration, as well as security sector reform.

0752. Influence means to alter the opinions and attitudes of a civilian population through information engagement, presence, and conduct. It aims to change behaviors through nonlethal means. Influence is as much a product of public perception as a measure of operational success. It reflects the ability of friendly forces to operate within the cultural and societal norms of the local populace while accomplishing the mission. Influence requires legitimacy. Developing legitimacy requires time, patience, and coordinated, cooperative efforts across the operational area.

0753. Support means to establish, reinforce, or set the conditions necessary for the other instruments of national power to function effectively. It requires coordination and cooperation with civilian agencies as they assess the immediate needs of failed or failing local governments and plan, prepare for, or executes responses to them. In extreme circumstances, support may require committing considerable resources for a protracted period. This commitment may involve establishing or re-establishing the institutions required for normal life. These typically include a legitimate civil authority, local market economy, and criminal justice system supported by government institutions for health, education, and civil service.

0754. **Using Defeat and Stability Mechanisms**. Defeat and stability mechanisms complement center of gravity analysis. This analysis helps to frame an operational-level problem; defeat and stability mechanisms suggest means to solve it. The analysis reveals the intrinsic vulnerabilities of a given center of gravity; defeat mechanisms describe ways to isolate, weaken, or destroy it. For example, a decisive point may be temporarily neutralized by dislocating it. The enemy may commit significant combat power to regain that capability, presenting an opportunity to destroy committed enemy forces. By combining dislocation and destruction, the commander can effectively eliminate the capability. Thus, the effect on the center of gravity is permanent, and friendly forces retain freedom of action and initiative.

0755. The operational approach reflects the commander's visualization for applying combinations of defeat and stability mechanisms. An effective operational approach, direct or indirect, focuses operations toward establishing the end state.

Decisive Points

0756. A *decisive point* is a geographic place, specific key event, critical factor, or function that, when acted upon, allows commanders to gain a marked advantage over an adversary or contribute materially to achieving success. Decisive points are not centers of gravity; they are keys to attacking or protecting them. Logically, every critical capability, critical requirement or critical vulnerability can be translated into a decisive point. It may, however, require other decisive points that correspond to specific Army capabilities.

0757. Decisive points apply at both the operational and tactical levels. At the operational level, they typically provide direct leverage against a center of gravity. At the tactical level, they are directly tied to mission accomplishment.

0758. Some decisive points are geographic. Examples include port facilities, distribution networks and nodes, and bases of operations. Specific events and

elements of an enemy force may also be decisive points. Examples of such events include commitment of the enemy operational reserve and reopening a major oil refinery. A common characteristic of decisive points is their major importance to a center of gravity. A decisive point's importance requires the enemy to commit significant resources to defend it. The loss of a decisive point weakens a center of gravity and may expose more decisive points.

0759. Decisive points have a different character during operations dominated by support to civil governance operations. These decisive points may be less tangible and more closely associated with important events and conditions. For example, during operations after a natural calamity, reopening schools is a decisive point. Other examples include:

a. Repairing a vital water treatment facility.

b. Establishing a training academy for national security forces.

c. Securing an election.

d. Quantifiably reducing crime.

0760. None of these examples is purely physical. Nonetheless, any may be vital to establishing conditions for transitioning to civil authority. In an operation dominated by support to civil governance, this transition is typically an end state condition.

0761. Commanders identify the decisive points that offer the greatest leverage against centers of gravity. Decisive points that enable commanders to seize, retain, or exploit the initiative are crucial. Controlling them is essential to mission accomplishment. Enemy control of a decisive point may exhaust friendly momentum, force early culmination, or allow an enemy counterattack. Decisive points shape the design of operations. They help commanders select clearly decisive, attainable objectives that directly contribute to establishing the end state.

Lines of Operation and Lines of Effort

0762. In an operational design, lines of operation and lines of effort bridge the broad concept of operations across to discreet tactical tasks. They link tactical and operational objectives to the end state. Continuous assessment gives commanders the information required to revise and adjust lines of operation and effort. Subordinate commanders reallocate resources accordingly.

0763. Commanders may describe an operation along lines of operations, lines of effort, or a combination of both. Irregular warfare, for example, typically requires a deliberate approach using lines of operation complemented with lines of effort; their combination may change based on the conditions within the operational area. An operational design using both lines of operation and lines of effort reflects the characteristics and advantages of each. With this approach, commanders synchronize and sequence actions, deliberately creating complementary and reinforcing effects. The lines then converge on the well-defined, commonly understood end state outlined in the commander's intent.

0764. **Lines of Operation.** A line of operation is a line that defines the directional orientation of a force in time and space in relation to the enemy and links the force with its base of operations and objectives (See figure 7.6). Lines of operation connect a series of decisive points that lead to control of a geographic or force-oriented objective. Operations designed using lines of operation generally consist of a series of actions executed according to a well-defined sequence. Major combat operations are typically designed using lines of operation. These lines tie offensive and defensive tasks to the geographic and positional references in the operational area. Commanders synchronize activities along complementary lines of operation to achieve the end state. Lines of operation may be either interior or exterior.

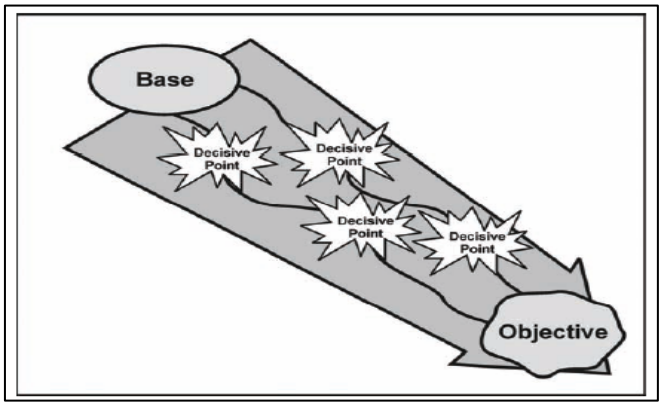

Figure 7.6 - Example of a Line of Operation

0765. A force operates on interior lines when its operations diverge from a central point. Interior lines usually represent a central position, where a friendly force can reinforce or concentrate its elements faster than the enemy force can reposition. With interior lines, friendly forces are closer to separate enemy forces than the enemy forces are to one another. Interior lines allow an isolated force to mass combat power against a specific portion of an enemy force by shifting capabilities more rapidly than the enemy can react.

0766. A force operates on exterior lines when its operations converge on the enemy. Operations on exterior lines offer opportunities to encircle and annihilate an enemy force. However, these operations typically require a force stronger or more mobile than the enemy.

0767. The relevance of interior and exterior lines depends on the time and space relationship between the opposing forces. Although an enemy force may have interior lines with respect to the friendly force, this advantage disappears if the friendly force is more agile and operates at a higher tempo. Conversely, if a smaller friendly force maneuvers to a position between larger but less agile enemy forces, the friendly force may be able to defeat them in detail before they can react effectively.

0768. **Lines of Effort**. A line of effort links multiple tasks and missions using the logic of purpose - cause and effect - to focus efforts toward establishing operational and strategic conditions. Lines of effort are essential to operational design when positional references to an enemy or adversary have little relevance. In operations involving many non-military factors, lines of effort may be the only way to link tasks,

effects, conditions, and the desired end state. Lines of effort are often essential to helping commanders visualize how military capabilities can support the other instruments of national power. It is a particularly valuable tool when used to achieve unity of effort in operations involving multinational forces and civilian organizations, where unity of command is elusive, if not impractical.

0769. Commanders use lines of effort to describe how they envision their operations, creating the more intangible end state conditions (See Figure 7.7). These lines of effort show how individual actions relate to each other and to achieving the end state. Ideally, lines of effort combine the complementary, long-term effects of support to civil governance tasks with the cyclic, short-term events typical of offensive or defensive tasks.

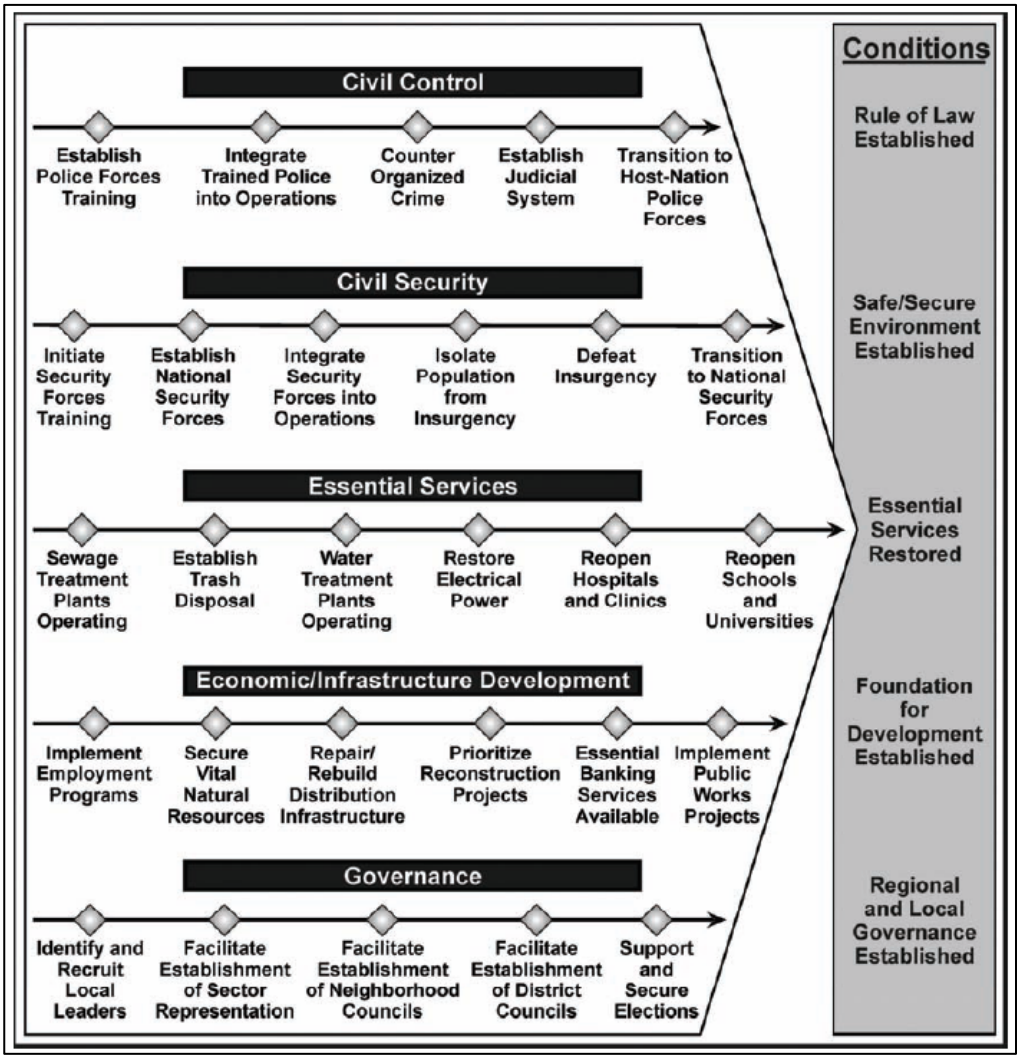

Figure 7.7 - Example of Lines of Effort

0770. Commanders at all levels may use lines of effort to develop missions and tasks and to allocate resources. Commanders may designate one line of effort as the decisive operation and others as shaping operations. Commanders synchronize and sequence related actions along multiple lines of effort. Seeing these relationships helps commanders assess progress toward achieving the end state as forces perform tasks and accomplish missions.

0771. As operations progress, commanders may modify the lines of effort after assessing conditions and collaborating with civilian partners. Lines of effort typically focus on integrating the effects of military operations with those of other instruments of national power to support the broader effort. Each operation, however, is different. Commanders develop and modify lines of effort to keep operations focused on achieving the end state, even as the situation changes.

0772. **Combining Lines of Operation and Lines of Effort**. Commanders use both lines of operation and lines of effort to connect objectives to a central, unifying purpose. Lines of operation portray the more traditional links between objectives, decisive points, and centers of gravity. However, lines of operation do not project the operational design beyond defeating enemy forces and seizing terrain. Combining lines of operation and lines of effort allows commanders to include non-military activities in their operational design. This combination helps commanders incorporate stability tasks that set the end state conditions into the operation. It allows commanders to consider the less tangible aspects of the operational environment where the other instruments of national power dominate. Commanders can then visualize concurrent and post-conflict activities. Making these connections relates the tasks and purposes of the elements of full spectrum operations with joint effects identified in the campaign plan. The resulting operational design effectively combines full spectrum operations throughout the campaign or major operation.

Refining the Design

0773. Refining the design examines how commanders should execute the operation in the operational environment. Commanders determine their force's operational reach and culminating point. They also determine the tempo that will allow them to accomplish the mission without culminating. They consider several aspects of simultaneity and depth. These considerations include the emphasis each element of full spectrum operations will receive and the extent to which the force can operate throughout the operational area. When necessary, commanders phase the operation and plan transitions to maintain momentum. Throughout this activity, commanders consider the risks they are willing to accept.

Operational Reach

"The third factor, the distance from the sources that must send continual replacements for this steadily weakening army, will increase proportionately with the advance. In this respect a conquering army is like the light of a lamp; as the oil that feeds it sinks and draws away from the focus, the light diminishes until at last it goes out altogether."

Carl von Clausewitz
On War

0774. Operational Reach is the distance and duration across which a unit can successfully employ military capabilities. It reflects the ability to achieve success through a well-conceived operational approach. Operational reach is a tether; it is a function of protection, sustainment, endurance, and relative Army power. The limit of

a unit's operational reach is its culminating point. Operational design extends operational reach while creating the conditions necessary to seize, retain, and exploit the initiative. It balances the natural tension between endurance, momentum, and protection. The following actions can extend operational reach:

a. Forward positioning of forces, reserves, bases, and support capabilities along lines of operations.

b. Employing weapons systems with extended ranges, such as missiles.

c. Phasing an operation to focus limited resources.

d. Leveraging supply discipline, contracting, and host-nation support. Maximizing distribution network efficiency.

e. Leveraging joint capabilities.

0775. Endurance is the ability to employ combat power anywhere for protracted periods. It stems from the ability to generate, protect, and sustain a force, regardless of the distance from its base and the austerity of the environment. Endurance involves anticipating requirements and making the most effective, efficient use of available resources. Their endurance gives Army forces their campaign capability. It makes permanent the transitory effects of other capabilities.

0776. Momentum comes from seizing the initiative and executing high-tempo operations that overwhelm enemy resistance. Commanders control momentum by maintaining focus and pressure. They set a tempo that prevents exhaustion and maintains sustainment. A sustainable tempo extends operational reach. Commanders maintain momentum by anticipating and transitioning rapidly between primary tasks or – when necessary - the elements of full spectrum operations. Sometimes commanders must push the force to its culminating point to take maximum advantage of an opportunity. For example, exploitations and pursuits often involve pushing all available forces to the limit of their endurance to capitalize on momentum and retain the initiative.

0777. Protection is an important contributor to operational reach. Commanders anticipate how enemy actions might disrupt operations and then determine the protection capabilities required to maintain sufficient reach. Protection closely relates to endurance and momentum. It also contributes to the commander's ability to extend operations in time and space. The protection warfighting function helps commanders maintain the deploying force's integrity and Army power.

0778. An operational pause is a deliberate halt taken to extend operational reach or prevent culmination. Commanders may execute an operational pause for several reasons. These may include the force being close to culmination, the decisive operation failing, or the strategic end state changing. In designing an operation, commanders carefully balance initiative, momentum, reach, and culmination to avoid unnecessary operational pauses. In protracted operations, however, they may have to execute operational pauses to extend operational reach. Commanders carefully plan, prepare for, and execute these pauses to prevent losing the initiative. During an

operational pause, commanders retain the initiative by using shaping operations to keep pressure on enemy forces. These shaping operations confuse the enemy while friendly forces generate Army power for the decisive operation.

0779. Operational design balances operational reach, operational approach, and operational pauses to ensure Army forces accomplish their missions before culminating. Commanders continually strive to extend operational reach. They assess friendly and enemy force status, anticipate culmination, and plan operational pauses if necessary. Since the time of Sun Tzu, commanders have studied and reflected on the challenge of conducting and sustaining operations over long distances and times. History contains many examples of campaigns hampered by inadequate operational reach. Achieving the desired end state requires forces with the operational reach to establish and maintain the end state conditions.

Tempo

0780. Tempo is the relative speed and rhythm of military operations over time with respect to the enemy or situation. It reflects the rate of military action. Controlling tempo helps commanders keep the initiative during combat operations or rapidly establish a sense of normalcy during humanitarian crises. During operations dominated by the offense and defense, commanders normally seek to maintain a higher tempo than the enemy; rapid tempo can overwhelm an enemy's ability to counter friendly actions. During operations dominated by support to civil governance, commanders act quickly to control events. By acting faster before the situation deteriorates, commanders can change the dynamics of a crisis and restore stability. The capability to act quickly enhances flexibility and adaptability across the spectrum of conflict.

0781. Commanders control the tempo through deliberate operational design. First, they formulate operations that stress the complementary and reinforcing effects of simultaneous and sequential operations. They synchronize those operations in time and space to degrade enemy capabilities throughout the operational area. Second, commanders avoid unnecessary engagements. This practice includes bypassing resistance that appears at times and places commanders do not consider decisive. Third, through mission command they give subordinates maximum latitude to exercise initiative and act independently. Controlling tempo requires both audacity and patience: audacity initiates the actions needed to develop a situation; patience allows the situation to develop until the force can strike at the decisive time and place. Ultimately, the goal is maintaining tempo appropriate to retaining the initiative and achieving the end state.

0782. Army forces expend more energy and resources when operating at a high tempo. Commanders assess the force's capacity to operate at a high tempo based on its performance and available resources. An effective operational design varies tempo throughout an operation to increase endurance while maintaining appropriate speed and momentum. There is more to tempo than speed. While speed can be important, commanders balance speed with endurance.

Simultaneity and Depth

0783. Simultaneity and depth extend operations in time and space. Simultaneous combinations of offensive, defensive, and support to civil governance tasks overwhelm enemy forces and their will to resist while setting the conditions for a lasting, stable peace. Simultaneous actions across the depth of the operational area place more demands on enemy forces than they can effectively respond to them. Operations combining depth and simultaneity achieve a synergy that paralyzes enemy forces. This prevents them from reacting appropriately, inducing their early culmination. Similarly, support to civil governance tasks, executed in depth with simultaneous defensive and offensive tasks when necessary, establish control of the situation throughout the operational area.

0784. Simultaneity also refers to the concurrent effects operations produce at the tactical, operational, and strategic levels. Tactical commanders fight the battles and engagements that achieve objectives in accordance with the operational commander's intent. Operational commanders set the conditions for tactical success in battles within a campaign or major operation. These victories, in turn, create the conditions that define the end state. Because of the complex interaction among the levels of army operations, commanders cannot be concerned only with events at their respective echelon. Success requires them to understand how their actions affect the operations of commanders at all other echelons.

0785. Depth is the extension of operations in time, space, and resources. Operations in depth can disrupt the enemy's decision cycle. These operations contribute to protecting the force by destroying enemy capabilities before the enemy can use them. Commanders balance their forces' tempo to produce simultaneous results throughout their operational area. To achieve simultaneity, commanders establish a higher tempo to target enemy capabilities located at the limit of a force's operational reach.

0786. Simultaneity and depth are inherent in full spectrum operations. Army forces execute simultaneous operations across vast areas. They force the enemy to react to numerous friendly actions - potential and actual - throughout the operational area. Army forces use combined arms, advanced information systems, and joint capabilities to increase the depth of their operations. The complementary effects produced by executing simultaneous operations in depth overwhelm enemy forces, forcing them to respond piecemeal or not at all.

0787. Commanders extend the depth of operations through joint integration. When determining an operation's depth, commanders consider their own capabilities, as well as joint capabilities and limitations. They use these capabilities to ensure actions executed at operational depth receive robust and uninterrupted support. Commanders sequence and synchronize operations in time and space to achieve simultaneous effects throughout the operational area.

Phasing and Transitions

0788. A phase is a planning and execution tool used to divide an operation in duration or activity. A change in phase usually involves a change of mission, task organization, or rules of engagement. Phasing helps in planning and controlling and may be

indicated by time, distance, terrain, or an event. The ability of Army forces to extend operations in time and space, coupled with a desire to dictate tempo, often presents commanders with more objectives and decisive points than the force can engage simultaneously. At both the operational and tactical levels, this situation may require commanders and staffs to consider sequencing operations. Sequencing involves integrating capabilities and synchronizing actions within the operational design. This is accomplished through phasing.

0789. Phasing is key to arranging complex operations. It describes how the commander envisions the overall operation unfolding. It is the logical expression of the commander's visualization in time. Within a phase, a large portion of the force executes similar or mutually supporting activities. Achieving a specified condition or set of conditions typically marks the end of a phase.

0790. Simultaneity, depth, and tempo are vital to full spectrum operations. However, they cannot always be attained to the degree desired. In such cases, commanders limit the number of objectives and decisive points engaged simultaneously. They deliberately sequence certain actions to maintain tempo while focusing Army power at the decisive point in time and space. Commanders combine simultaneous and sequential operations to achieve the end state conditions.

0791. Phasing can extend operational reach. Only when the force lacks the capacity to accomplish the mission in a single action do commanders phase the operation. Each phase should strive to:

a. Focus effort.

b. Concentrate Army power in time and space at a decisive point.

c. Deliberately and logically achieve its objectives.

0792. Transitions mark a change of focus between phases or between the ongoing operation and execution of a branch or sequel. Shifting priorities between the elements of full spectrum operations - such as from offense to support to civil governance - also involves a transition. Transitions require planning and preparation well before their execution to maintain the momentum and tempo of operations. The force is vulnerable during transitions, and commanders establish clear conditions for their execution. Transitions may create unexpected opportunities; they may also make forces vulnerable to enemy threats.

0793. An unexpected change in conditions may require commanders to direct an abrupt transition between phases. In such cases, the overall composition of the force remains unchanged despite sudden changes in mission, task organization, and rules of engagement. Typically, the task organization evolves to meet changing conditions; however, transition planning must also account for changes in mission. Commanders attuned to sudden changes can better adapt their forces to dynamic conditions. They continually assess the situation and task-organize and cycle their forces to retain the initiative. They strive to achieve changes in emphasis without incurring an operational pause.

Culmination

0794. The culminating point is that point in time and space at which a force no longer possesses the capability to continue its current form of operations. Culmination represents a decisive shift in relative Army power. It is relevant to both attackers and defenders at each level of army operations. In the offense, the culminating point occurs when the force cannot continue the attack and must assume a defensive posture or execute an operational pause. In the defense, it occurs when the force can no longer defend itself and must withdraw or risk destruction.

0795. With support to civil governance, the culminating point is more difficult to identify. These conditions can result in culmination:

a. Being too dispersed to adequately control the situation.

b. Being unable to provide the necessary security.

c. Adversely losing local population support.

d. Lacking required resources.

e. Responding to more catastrophic events than they can manage simultaneously.

0796. Strategic culmination occurs when a nation or other opponent no longer has the resources to continue the conflict. Strategic culmination occurs only once during a campaign. It marks when one side can no longer maintain a favorable ratio of military resources and the likelihood of a successful outcome rapidly diminishes. Attackers are compelled to assume the defense or risk defeat. Defenders are forced to sue for peace or face destruction and possibly occupation. Strategic culmination may result from:

a. Erosion of domestic national or political will.

b. Decline of popular support.

c. Lack of focus or other resources.

d. Excessive casualties.

0797. At the operational level, factors influencing culmination are complex. Culminating points at the operational level are linked to time, space, and existing Army power. They directly correspond to the ability to apply available Army power across a set distance within a given period. Operational-level forces are also vulnerable to tactical culmination. The interdependent nature of these factors creates uncertainty. This makes it difficult to anticipate operational and strategic culminating points. The loss of critical capabilities or an unanticipated tactical success can quickly shift the advantage between opposing forces.

0798. At the tactical level, culmination may be a planned event. In such cases, the concept of operations predicts which part of the force will culminate, and the task organization includes additional forces to assume the mission. Culmination is

expected and measures are in place to mitigate it. Tactical culminating points are easier to identify than operational culminating points because they generally occur as a result of a battle or engagement. Tactical culmination is typically caused by direct combat actions or higher echelon resourcing decisions. It relates to the force's ability to generate and apply Army power and is not a lasting condition. Tactical units may be reinforced or reconstituted to continue operations.

Risk

0799. Risk, uncertainty, and chance are inherent in all military operations. When commanders accept risk, they create opportunities to seize, retain, and exploit the initiative and achieve decisive results. Risk is a potent catalyst that fuels opportunity. The willingness to incur operational risk is often the key to exposing enemy weaknesses that the enemy considers beyond friendly reach. Understanding risk requires calculated assessments coupled with boldness and imagination. Successful commanders assess risk continuously throughout operations and mitigate it through creative operational design.

07100. It is reckless to commit forces without adequate planning and preparation. It is equally rash to delay action while waiting for perfect intelligence and synchronization. Reasonably estimating and intentionally accepting risk is fundamental to conducting operations. It is essential to successful battle command. Successfully applying military force requires commanders who assess the risks, analyze and minimize the hazards, and execute a plan that accounts for those hazards. Experienced commanders balance audacity and imagination with risk and uncertainty to strike at a time and place and in a manner wholly unexpected by enemy forces. This is the essence of surprise. It results from carefully considering and accepting risk.

07101. Operational art balances risk and opportunity to create and maintain the conditions necessary to seize, retain, and exploit the initiative and achieve decisive results. During execution, opportunity is fleeting. The surest means to create opportunity is to accept risk while minimizing hazards to friendly forces. A good operational design considers risk and uncertainty equally with friction and chance. The final plans and orders then provide the flexibility commanders need to take advantage of opportunity in complex, dynamic environments.

Chapter VIII
Enabling Operations

"The Army will employ everything that can be used for increasing training and fighting efficiency. Doing this requires continuous meetings of the minds between military leadership and the leaders and experts of a wide range of skills and disciplines in the nation as a whole. Each side must understand the others' capabilities. Each must recognize the real and imagined limitations of education, economics, production, resources and – most importantly – will."

The Philippine Army Officers' Handbook

0801. Full spectrum operations require enabling operations to ensure success. Enabling operations are necessary elements across the range of army operations. Commanders direct enabling operations to support offensive, defensive, and support to civil governance operations. Enabling operations are usually shaping or sustaining; they may be decisive in some support to civil governance operations. Directing enabling operations is an intrinsic function of command and the art of operations. Alone, enabling operations cannot assure success; however, neglecting them can result in mission failure. Enabling operations address the following areas that directly impact on the conduct of offense, defense and support to civil governance operations: information superiority, sustainment support operations and interagency coordination and convergence.

Information Superiority

0802. The side possessing better information and using that information more effectively to gain understanding has a major advantage over its opponent. A force that achieves this advantage and effectively uses it to affect enemy perceptions, attitudes, decisions, and actions has exploited information superiority.

Achieving Information Superiority

0803. Information Superiority is the operational advantage derived from the ability to collect, process, and disseminate an uninterrupted flow of information while exploiting or denying an adversary's ability to do the same. Commanders exploit information superiority to accomplish missions. Information superiority is not static. During operations, all sides attempt to secure its advantages and deny them to adversaries and enemies. The operational advantages of information superiority can take several forms, ranging from the ability to create a better operational picture and understand it in context, to the ability to shape the environment with offensive information operations (IO).

0804. At its essence, information superiority is about Army forces being able to see first, understand first, and act first. Army forces cannot develop information superiority if they are constantly reacting to enemy operations. Information superiority requires commanders who are proactive, view information as an element of Army power, trust their subordinates to provide relevant information, and conduct (plan, prepare, execute, and continuously assess) operations accordingly. To achieve information superiority, commanders synchronize and target information as intensely as they do fires and maneuver. They seek to make better use of their information and information systems than adversaries or enemies do of theirs. These information systems include the analysis, procedures, and training necessary to extract and exploit intelligence and other critical information from raw data, and present it in a form in which it can be quickly understood. Successful commanders are those who see, understand, and then exploit the situation.

Characteristics of Information Superiority

0805. Gaining and exploiting information superiority demands effective doctrine, training, leadership, organization, materiel, and soldiers. It puts a premium on the commander's ability to visualize, describe, and direct operations. Effective use of advanced information systems, procedures, and training allows commanders to achieve and maintain situational understanding. Modern information technologies help commanders lead more effectively and consistently make better decisions than those opposing them.

0806. Commanders manage their information resources, combine their judgment with the knowledge of their staffs and subordinates, and use information systems to understand their operational space better than their adversaries or enemies do. Commanders require relevant information about the factors of METT-TC to exercise effective command and control (C2). From the initial warning order to completion of redeployment, Army forces use every means, including force, to acquire that information. At the same time, they attempt to deny adversaries and enemies information about friendly forces and actively degrade their ability to collect, process, store, display, and disseminate information. Effective friendly use of information complemented with active measures that prevent enemies from using information effectively or countering friendly information use, creates conditions for achieving information superiority. Army forces use the qualitative advantages of information superiority as a springboard for decisive operations.

0807. The operational and tactical implications of information superiority are profound. Rapid seizure and retention of the initiative becomes the distinguishing characteristic of all operations. Information superiority allows commanders to make better decisions more quickly than their enemies and adversaries. Unable to keep pace, enemies and adversaries must deal with new problems before they can solve current ones. In combat, a rapid tempo, sustained by information superiority, can outpace the enemy's ability to make decisions and contribute to his destruction. In support to civil governance operations, information superiority helps deploying forces anticipate problems and requirements. It allows commanders to control events and

situations earlier and with less force, creating the conditions necessary to achieve the end state.

0808. Adversaries and enemies pursue their own relative information advantages, very likely in asymmetric ways, while continually attempting to deny information superiority to friendly forces. Because opposing forces constantly adapt and situations continually evolve, information superiority is relative and transitory. Absolute information superiority is not possible. Commanders assess the quality of their information against their decision making requirements. Against that assessment, they estimate the quality of the enemy's operational picture. Commanders avoid any complacency associated with relative levels of military technology. They are aware that their enemy may, by chance or countermeasures, uncover the sources of friendly informational advantage, block them, or use them to deceive.

0809. Commanders recognize that unless they envision and direct operations designed to achieve and maintain information superiority, they may lose it. Commanders exploit any advantages in information capability and intelligence to increase the effects of Army power. They constantly seek to improve their situational understanding and to assess that of their enemy. They know that losing information superiority may result in losing the initiative.

0810. Information superiority requires extensive planning and preparation. It cannot be an afterthought. As an element of Army power, information requires the same attention as the other elements. The foremost information superiority planning requirement is vertical and horizontal integration of ISR, IO, and IM. Army force plans support joint force commander (JFC) objectives and receive support from the JFC. In particular, offensive IO follows a common theme and is directed against supporting objectives. If not integrated, IO at different echelons may counteract each other.

0811. Preparation focuses on IM and deploying the right ISR assets to support the force. Because Army forces are in varying states of modernization, the integration of information systems requires not only careful planning but also rehearsal and testing, whenever time permits. IM planning ensures that Army forces are able to disseminate relevant information vertically and horizontally. Commanders assess their information requirements against collection capabilities and tailor the force accordingly.

0812. Continuous coordination distinguishes effective C2. The impact of information technologies increases the importance of coordination. There is an unfortunate tendency to accept everything that appears on a computer screen. Coordination, focused by CCIR, verifies information. Constant coordination identifies friction in IM and develops solutions. Coordination between humans becomes the lubricant that drives IM within each headquarters. Commanders emphasize the necessity of coordination between higher and lower units as well as adjacent and supporting units. Commanders coordinate with other commanders; they understand that coordination, while primarily the task of the staff, is not solely a staff responsibility.

0813. Non-contiguous areas of operations challenge commanders to use intelligence elements, reconnaissance units, and surveillance systems efficiently and imaginatively. When operating in non-contiguous AOs, commanders focus collection

operations on areas between formations. Surveillance and reconnaissance assets cover areas between non-contiguous AOs. When the area requiring coverage exceeds the capabilities of reconnaissance units, commanders coordinate for additional coverage, with joint elements if available. When necessary, commanders task other forces to complement surveillance and reconnaissance assets.

The Information Environment

0814. The Information Environment is the combination of individuals, organizations or automated systems that collect, process, disseminate or act on information. This also includes the information itself. Nowadays military operation can be possibly accessed and be known by near or far reaching audiences in today's information environment where information itself is interactive and pervasive. The presence and influence of the current and emerging electronic information technology may allow the access of information in both civilian and military operations to be known locally or globally. Likewise, access of internet information may possibly be known by the researching public even without censorship.

0815. The actors include leaders, individuals, and organizations. Resources include materials and systems used to collect, process, store, disseminate, display and protect information. Human and automated systems observe, orient, decide, and act upon information in the information environment, making it the principal environment for decision-making.

0816. Friendly, adversarial, or neutral individuals, organizations, and systems in the information environment rely upon credible, timely, and useable information in formulating their opinions or perceptions to form an effective decision. Successful planning and execution of any military mission is dependent upon an accurate assessment and full understanding of the information environment. (See Figure 8.1)

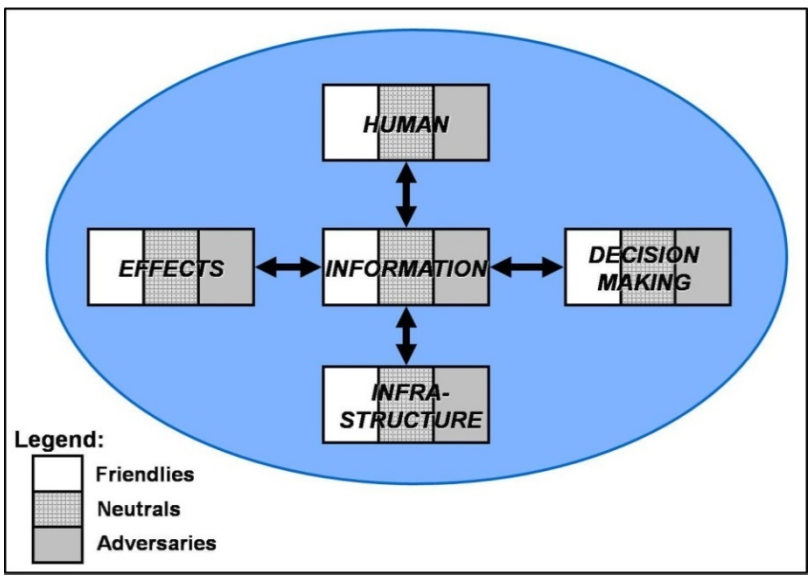

Figure 8.1 - The Information Environment

0817. The Information Environment is composed of five (5) interrelated components: Human, Infrastructure, Information, Decision-making and Effects. Most of the information environment is not under military control, adding to the challenges commanders face. While they cannot control the entire information environment, they must be prepared to operate within it. Interaction with the information environment increases the complexity of Army operations. More than ever, commanders consider how factors outside their area of operations (AO) may affect their operations. Information Operations (IO) often requires coordination with governmental and nongovernmental agencies. Legal limitations on IO vary according to the situation. This interaction may affect the impact of tactics on operations and strategy. Military actions that are tactically or operationally insignificant may influence strategy, or even national policy, when highlighted by the media. Therefore, operational commanders consider more than the military conditions of the end state of a campaign. They consider the comprehensive political, economic, environmental and social aspects of it as well.

0818. Army forces increasingly rely on the unrestricted use of the information environment. Commanders and staffs need to understand its effects on operations and develop C2 systems that support their operational needs and intelligence requirements. Distance has little meaning in the information environment. Army information systems are “in contact” with enemy information systems before any operation starts. They remain in contact after the operation ends. Commanders understand that there is no sanctuary for friendly information. Before Army forces arrive in an AO, the battle for information superiority begins. Commanders and staff conduct operations accordingly.

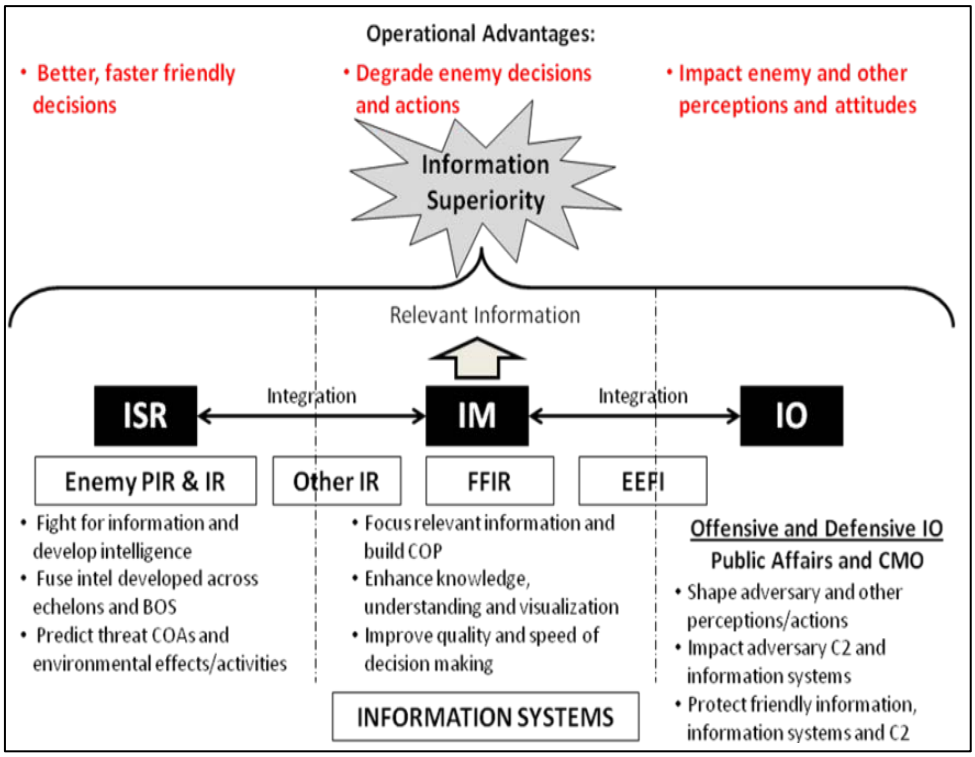

Figure 8.2 - Contributors to Information Superiority

Contributors to Information Superiority

0819. Commanders direct three interdependent contributors to achieve information superiority (See Figure 8.2):

a. Intelligence, Surveillance, and Reconnaissance (ISR).

b. Information Management (IM).

c. Information Operations (IO) (to include related activities).

0820. These contributors enable and complement full spectrum operations. Specific objectives that contribute to information superiority include the following:

a. Develop and maintain a comprehensive picture of enemies and adversaries; forecast their likely actions.

b. Deny enemies and adversaries information about friendly forces and operations.

c. Influence enemy and adversary leader perceptions, plans, actions, and will to oppose friendly forces.

d. Influence non-combatants and neutrals to support friendly missions or not to resist friendly activities.

e. Inform non-combatant and neutral organizations so they can better support friendly policies, activities, and intentions.

f. Protect friendly decision making processes, information, and information systems.

g. Continually provide relevant information (including intelligence) to the commander and staff in a useable form.

h. Destroy, degrade, disrupt, deny, deceive, and exploit enemy decision-making processes, information, and information systems, and influence those of adversaries and others.

0821. Commanders wage the struggle for information superiority throughout the information environment, not only in the AO. Superiority in one contributor alone does not ensure information superiority. For example, Army forces may have better IM than a less sophisticated enemy. However, superior intelligence and better security may give the enemy commander more information about Army forces than they have about the enemy. Uncoordinated actions within single contributors are ineffective. Information superiority results when commanders synchronize all three contributors.

Intelligence, Surveillance, and Reconnaissance (ISR)

0822. ISR integration is fundamental to information superiority. Thoroughly integrated ISR operations add many collection sources. ISR integration eliminates unit and functional "stovepipes" for planning, reporting, and processing information and producing intelligence. It provides a common mechanism for all units to conduct ISR operations in a coordinated, synergistic way.

0823. ISR operations allow units to produce intelligence on the enemy and environment (to include weather, terrain, and civil considerations) necessary to make decisions. This intelligence answers requirements developed throughout the operations process. Timely and accurate intelligence encourages audacity and can facilitate actions that may negate enemy superiority in soldiers and materiel. Normally, timely and accurate intelligence depends on aggressive and continuous reconnaissance and surveillance.

0824. **Intelligence**. The complexity of the operational environment requires sharing intelligence from the national level to the tactical level and among headquarters at each level. Analysis is a complex task that requires fusing information and intelligence from each ISR discipline and asset into an all-source product. Analysis is increasingly distributed and collaborative. Analysts who are closest to the point of collection enter data and perform initial processing one time for the entire force. Modern information systems allow analysts to collaborate on the overall analysis without degrading support to their own commanders, regardless of their geographic dispersion. This distributed, collaborative analysis process starts with the initial intelligence preparation of the operating environment (IPOE)and continues throughout operations.

0825. The commander drives the intelligence system. Managing the ISR effort entails:

a. **Requirements Visibility**. Intelligence personnel use procedures and information systems to monitor and display the status of information requirements;

b. **Asset Visibility**. Intelligence personnel use procedures and information systems to monitor and display collection asset status, location, and activities; and,

c. **ISR Assessment Capability**. Intelligence personnel use procedures and information systems to assess the effectiveness of the ISR effort and the operational impact of ISR results (such as its success or gaps in collection), and to task collection assets.

0826. Intelligence provides critical support to all operations, including IO. It supports planning, decision making, target development, targeting, and protecting the force. It is a continuous process for any operation. Surveillance and reconnaissance are the primary means of collecting information used to produce intelligence. A thorough understanding of joint ISR capabilities allows commanders to prepare complementary collection plans. Surveillance and reconnaissance assets focus primarily on collecting information about the enemy and the environment to satisfy the priority intelligence

requirements (PIR). In the end, the art of intelligence and its focus on supporting the commander are more important than any information system. This art includes an understanding of intelligence, analysis, the enemy, operations, and the commander's needs.

0827. The Intelligence Preparation of the Operational Environment (IPOE) is composed of appropriately different techniques in placing an operation in context, vis-à-vis the operational environment. One of the techniques is the IntelligencePreparation of the Battlefield (IPB). It drives the process that commanders and staff use to focus information assets and to integrate surveillance and reconnaissance operations across the AO. IPB provides commanders with information about the enemy and environment, and how these factors affect the operation. In most cases, IPB allows commanders to fill gaps in information about the enemy with informed assessments and predictions. IPB is also the starting point for situational development, which intelligence personnel use to develop the enemy and environment portions of the common operational picture (COP).

0828. Another technique derived from our experience in counterinsurgency operations is the Graphical Estimate of the Situation (GES) that can be adapted to the other operating environments. Although not as thorough as the IPB, it is a very good tool in the development and updating of the COP.

0829. As such, IPB and GES are important to the commander's visualization. The commander drives IPB and GES, and the entire staff assists the intelligence staff with continuous updates. All staff officers develop, validate, and maintain IPB and GES components relating to their areas of expertise. For example, the engineer contributes and maintains current mobility and counter-mobility situation overlays. Other techniques derived from the IPB and GES can be used in the different operational environments that cater to their unique information requirements and analyses. Their products can be collectively summarized in the Intelligence preparation of the Operational Environment (IPOE).

0830. **Surveillance**. Surveillance involves continuously observing an area to collect information. Wide-area and focused surveillance provide valuable information. Army forces at all echelons receive intelligence based on information from national, joint, Army, and commercial surveillance systems. National and regional surveillance systems focus on information requirements for unified commanders and provide information to all services for nation and region-wide operations. Continuous surveillance helps analysts determine the location and approximate dispositions of enemy forces.

0831. Although the Army may enjoy an advantage in surveillance assets in some areas, commanders should assume that enemies also have adequate surveillance means. For example, an enemy may use the local populace to report Army force actions.

0832. **Reconnaissance**. Reconnaissance collects information and can validate current intelligence or predictions. Reconnaissance units, unlike other units, are designed to collect information. Information collected by means other than reconnaissance has great operational and tactical value. However, those assets may not be able to meet

some requirements or collect information with adequate accuracy and level of detail. Operational priorities may limit ground commanders' ability to task surveillance systems. Therefore, Army commanders complement surveillance with aggressive and continuous reconnaissance. Surveillance, in turn, increases the efficiency of and reduces the risk to reconnaissance elements by focusing their operations.

0833. In some situations, the firepower, flexibility, survivability, and mobility of reconnaissance assets allow them to collect information where other assets cannot. Reconnaissance units obtain information on adversary and potential enemy forces as well as on the characteristics of a particular area. Reconnaissance missions normally precede all operations and begin as early as the situation, political direction, and rules of engagement permit. They continue aggressively throughout the operation. Reconnaissance can locate mobile enemy C2 assets, such as base camps, communication nodes, and satellite camps for neutralization, attack, or destruction. Commanders at all echelons incorporate reconnaissance into the conduct of operations.

0834. Continuous and aggressive reconnaissance does more than collect information. It may also produce effects or prompt enemy actions. The enemy may take forces needed elsewhere to counter friendly reconnaissance efforts. Hostile forces sometimes mistake reconnaissance units for the decisive operation and prematurely expose their dispositions or commit their reserves. Friendly commanders may exploit opportunities revealed by friendly reconnaissance, often using the reconnaissance force as the spearhead. Information from reconnaissance missions allows commanders to refine or change plans and orders, preclude surprises, and save the lives of soldiers.

0835. Reconnaissance elements may have to fight for information. However, the purpose of reconnaissance is to gain information through stealth, not initiate combat. Reconnaissance operations that draw significant combat power into unplanned actions not in line with the commander's intent may jeopardize mission accomplishment.

0836. Commanders integrate ISR missions into a single plan that capitalizes on their different capabilities. They synchronize reconnaissance and surveillance missions that employ maneuver units with both the ISR plan and scheme of maneuver.

Information Management (IM)

0837. Information Management is the provision of relevant information to the right person at the right time in a usable form to facilitate situational understanding and decision making. It uses procedures and information systems to collect, process, store, display, and disseminate information. IM is far more than technical control of data flowing across networks. It communicates decisions that initiate effective actions to accomplish missions and fuses information from many sources. Successful IM adds meaning to information as it is processed, so decision makers can focus on achieving understanding instead of processing or evaluating information. IM consists of two supporting components: information systems and relevant information.

0838. Successful IM includes processing. Processing adds meaning to relevant information through progressively higher-level and complex cognitive methods to create a COP. Among other aspects, processing includes lower level mechanical and

mechanistic methods, such as organizing, collating, plotting, and arranging. However, effective processing requires analysis and evaluation (higher-level cognitive methods) to convert information into knowledge and knowledge into understanding. This aspect of processing depends on the insight and flexibility of well-trained and adaptive analysts.

0839. Commanders and staffs assess the effectiveness of IM by considering how information contributes to lessening the "fogs of war." First, untimely information or unusable data has the same effect as not having the information. It either arrives too late or cannot be understood in time to affect the commander's decision. Second, incomplete or imprecise information is better than no information. While not perfect, it contributes to the commander's grasp of the situation and may assist decision making. Finally, irrelevant or inaccurate information is worse than no information. Irrelevant information distracts and delays; inaccurate information may lead to an inappropriate decision. Computers and software cannot make these qualitative distinctions; making them requires soldiers with good judgment.

0840. **Information Systems.** Information systems are the equipment and facilities that collect, process, store, display and disseminate information. These include computers - hardware and software - and communications, as well as policies and procedures for their use. Information systems are integral components of C2 systems. Effective information systems automatically process, disseminate, and display information according to user requirements.IM centers on commanders and the information relevant to C2.Commanders make the best use of information systems when they determine their information requirements and focus their staffs and organizations on meeting them.

0841. **Relevant Information**. Relevant information is all information of importance to commanders and staffs in the exercise of command and control. To be relevant, information must be accurate, timely, usable, complete, precise, and reliable. Relevant information provides the answers commanders and staffs need to successfully conduct operations, that is, all elements necessary to address the factors of METT-TC. The intelligence system, for example, provides intelligence that constitutes relevant information on the enemy, terrain and weather, time available (to the enemy), and civil considerations.

0842. Relevant information results from assigning meaning to data to assist understanding. Processing changes raw data into information by assigning meaning to it. Analysis and evaluation transform information into knowledge, which is presented to commanders as relevant information. When commanders apply judgment to knowledge, it becomes understanding. Understanding enables making informed decisions with less-than-perfect data. Combined with will, understanding generates effective action.

0843. Relevant information is perishable. If not delivered and acted upon quickly, it may become outdated (no longer relevant) and distort the commander's situational understanding. Masses of data and information may overwhelm the command post. Without effective IM, critical information will be misrouted, delayed, or buried in routine data and overlooked. Information systems can assist in managing volumes of

data, but will not do so unless commanders define their information requirements, tie them to their intent, and update them as execution unfolds.

0844. **Categories of Information**. IM narrows the gap between available information and information commanders require. Effective IM facilitates rapid dissemination of relevant information. IM assigns information into four categories: specified requirements, implied requirements, gaps, and distractions.

a. **Specified Requirements**. Specified requirements are requirements the commander specifically identifies. This information may take the form of facts, estimates, or assumptions.

b. **Implied Requirements**. Implied requirements are important pieces of information that commanders have not specifically requested. Full spectrum operations may place Army forces in situations that lie outside the commander's experience. Commanders may not know how to obtain some elements of information. They may not know that they need a piece of information or may not recognize its importance. Effective staffs develop and recommend these additional information requirements. Commanders encourage intellectual versatility and agility within their staff and examine recommendations carefully.

c. **Gaps**. Gaps are elements of information commanders need to achieve situational understanding but do not have. Ideally, analysis identifies gaps and translates them into specified requirements. To fill gaps, commanders and staffs make assumptions, clearly identifying them as such. There may be circumstances when commanders and staffs fail to identify a gap. Such circumstances are especially dangerous, particularly when facing an asymmetric threat. The commander not only does not have a piece of relevant information, but also does not know he needs it. This situation may result in the commander being surprised. Commanders and staffs remain adaptive and examine circumstances as they are, rather than fitting circumstances into preconceived notions.

d. **Distractions**. Distractions include information commanders do not need to know but continue to be told. Excessive distractions result in information overload.

0845. Information is further classified as facts, estimates, and assumptions. Facts are information commanders want to know and can know with certainty. A fact must be confirmed or come from a reliable source. Estimates and assumptions are information commanders want to know but cannot know with certainty. Commanders and staffs must use discipline in separating fact from assumption; otherwise they are vulnerable to deception or risk inaccurate situational understanding. Estimates and assumptions primarily include information about the enemy, the future, or factors over which commanders have little or no control.

0846. Facts, estimates, and assumptions can be either relevant information or distractions. They are relevant information if the commander both wants and needs to know the information. They are distractions if the commander wants to know but does

not need to know the information. Photographs, for example, can be distractions. Unless the commander clearly understands the imagery, demands for photos only clog overloaded information systems. Effective IM filters distractions from relevant information.

0847. **Quality of Information**. Sources of information are imperfect and susceptible to distortion and deception. Soldiers processing information use these qualities to evaluate it:

a. **Accuracy**. The information conveys the actual situation; in short, it is fact.

b. **Timeliness**. The information has not been overtaken by events.

c. **Usability**. The information is easily understood or displayed in a format that immediately conveys the meaning.

d. **Completeness**. The information contains all required components.

e. **Precision**. The information has the required level of detail, no more and no less.

f. **Reliability**. The information is trustworthy, uncorrupted, and undistorted.

0848. Effective IM keeps commanders and staffs aware of the quality of their information as they use it to build situational understanding.

0849. **Commander's Critical Information Requirements**. Commanders channel information processing by clearly expressing which information is most important. They designate critical information that derives from their intent, the commander's critical information requirements (CCIR). The commander's critical information requirements are elements of information required by commanders that directly affect decision making and dictate the successful execution of military operations. The key to effective IM is answering the CCIR.

0850. When commanders receive a mission, they and their staffs analyze it using the military decision making process. As part of this process, commanders visualize the operational space and the fight. CCIRs are those key elements of information commanders require to support decisions they anticipate. Information collected to answer the CCIR either confirms the commander's vision of the fight or indicates the need to issue a fragmentary order or execute a branch or sequel. CCIRs directly support the commander's vision of the battle; commanders develop them personally. Once articulated, CCIRs normally generate three types of supporting information requirements: priority intelligence requirements (PIR), friendly force information requirements (FFIR) and essential elements of friendly information (EEFI).

0851. **Common Operational Picture**. An operational picture is a single display of relevant information within a commander's area of interest. By collaborating, sharing, and tailoring relevant information, separate echelons create a COP. A common operational picture is an operational picture tailored to the user's requirements, based on common data and information shared by more than one command. The COP is

displayed at a scale and level of detail that meets the information needs of the command at a particular echelon. C2 systems fuse information from a variety of sources, while information systems facilitate its rapid distribution in usable displays that facilitate understanding.

0852. Different echelons require different information at different levels of precision and detail. The presentation of information in meaningful images assists its assimilation. IM provides relevant information as meaningful displays rather than masses of data. The COP allows collaborative interaction and real-time sharing of information among commanders and staffs without providing them with too much or too little information.

0853. The Army continues to invest in technologies and develop procedures that increase commanders' ability to understand their operational space. These modernizing efforts will increase the capability of Army forces to share a full dimensional, highly accurate COP and rapidly disseminate guidance, orders, and plans. Technological applications that help visualize, illustrate, brief, and rehearse options contribute to a common understanding of the commander's intent and concept of operations. Increasing the speed of analysis, compilation, and communication leaves more time for synthesis; assigning meaning to information and generating potential options.

0854. **Situational Understanding**. Situational Understanding is the product of applying analysis and judgment to the common operational picture to determine the relationships among the factors of METT-TC. It enhances decision making by identifying opportunities, threats to the force or mission accomplishment, and information gaps. It helps commanders identify enemy options and likely future actions, the probable consequences of proposed friendly actions, and the effects of the environment on both. Situational understanding based on a COP fosters initiative in subordinate commanders by reducing, although not eliminating, uncertainty (See Figure 8.3).

0855. Situational understanding has limits. It is imperfect, particularly with respect to the enemy situation. It requires constant verification. Situational understanding focuses on the current situation. It can reduce the friction caused by the fogs of war. However, achieving accurate situational understanding depends at least as much on human judgment as on machine-processed information, particularly when assessing enemy intent and combat power. Simply having a technologically assisted portrayal of the situation cannot substitute for technical and tactical competence. Additionally, portions of the force will not be modernized for some time. The level of situational understanding between modernized and less modernized units may vary over time. Commanders recognize the disparity between organizations and adjust procedures and subordinate unit missions accordingly.

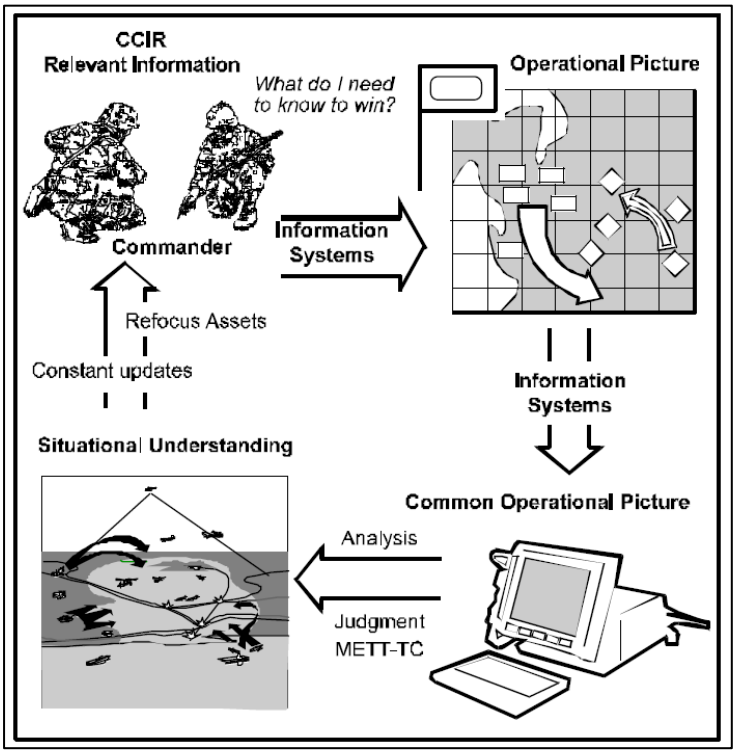

Figure 8.3 - Situational Understanding

0856. **Information Management in Full Spectrum Operations**.IM is a command responsibility. IM plans establish responsibilities and provide instructions for managing information. The IM plan is the commander's "concept of operations" for handling information. Effective IM plans cover the entire scope of operations. Designated staff elements refine the IM plan and provide overall management of information.

Information Operations (IO)

0857. Information Operations is the integrated and synchronized use of selected military and non-military capabilities in order to affect friendly, neutral, and adversarial human and automated decision-making systems while protecting our own.

0858. IO are primarily shaping operations that create and preserve opportunities for decisive operations.IO are both offensive and defensive. IO is used to affect desired audiences in order to carry out three (3) basic functions: Inform, Attack and Protect . (See Figure 8.4)

0859. Speed and accuracy of information available to military commanders are the significant factors in determining the outcome of the battlefield since the adversaries are likewise increasingly exploring the range of possibilities in implementing their own integrated IO actions as a form of asymmetric warfare that can be used to frustrate AFP military objectives. IO ensures the accuracy and timeliness of information required by the military commanders in defending our system from the exploitation effort of the adversary. On the other hand, IO is used to deny adversaries the access to their C2 information and other supporting automated infrastructures. It seeks to prevent the adversary's attainment of the true situation and deprives him of

situational urgency and awareness. Further, it influences the adversarial decision-makers to favor the conduct of friendly operations and actions.

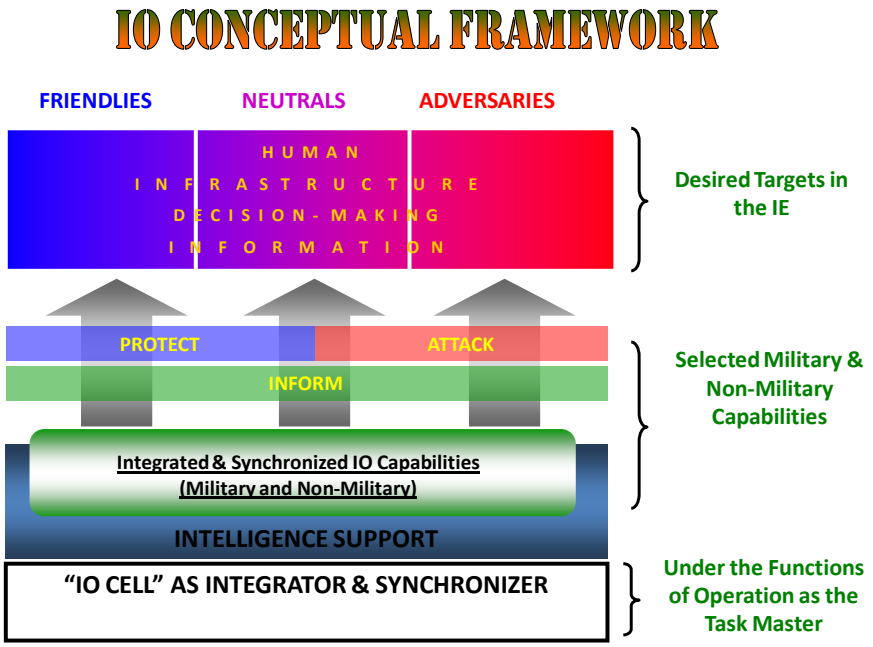

Figure 8.4 - Information Operations Conceptual Framework

0860. IO supports the commander's intent, purpose, desired operational effects and end state by integrating, synchronizing and coordinating all available military capabilities in order to produce favorable results to the IO operator and further produce measurable effects upon friendly & neutral audiences as well as the enemy/adversarial targets. Timeliness and accuracy of information available to military commanders must be decisive in the AO. Synchronized IO integrates all available capabilities to protect the AFP's relevant/critical/sensitive information, weapons, and communications systems from possible exploitation of the enemy/adversary or sympathizer while effectively using the IO capabilities in the accomplishment of the military mission. Similarly, IO is planned and executed to deliberately inform and influence the public and the institutional opinions in their perceptions and decisions that will be favorable to military operations.

0861. IO may involve complex legal and policy issues requiring careful review. It is imperative that IO is planned and executed in strict compliance with the customary laws or generally accepted principles of international laws, Philippine laws and the provisions of the Philippine Constitution. Further, IO planning and execution must always be guided by moral principles, societal values, human rights, Rules of Engagement (ROE), Laws of Armed Conflict (LOAC), and International Humanitarian Law (IHL).

0862. The value of IO is not in their effect on how well an enemy transmits data. Their real value is measured only by their effect on the enemy's ability to execute military actions. Commanders use IO to attack enemy decision making processes, information, and information systems. Effective IO allows commanders to mass

effects at decisive points more quickly than the enemy. IO is used to deny, destroy, degrade, disrupt, deceive, exploit, and influence the enemy's ability to exercise C2. To create this effect, friendly forces attempt to influence the enemy's perception of the situation.

0863. Similarly, IO and related activities affect the perceptions and attitudes of a host of others in the AO. These include the local population, displaced persons, and civilian leaders. IO are shaping operations that help commanders create favorable conditions for not only decisive operations but also sustaining operations. Commanders use IO and related capabilities to mitigate the effects of enemy IO, as well as adverse effects stemming from misinformation, rumors, confusion, and apprehension.

0864. Successful IO requires a thorough and detailed IPOE. IPOE includes information about enemy capabilities, decision-making style, and information systems. It also considers the effect of the media and the attitudes, culture, economy, demographics, politics, and personalities of people in the AO. Successful IO influences the perceptions, decisions, and will of enemies, adversaries, and others in the AO. Its primary goals are to produce a disparity in enemy commanders' minds between reality and their perception of reality, and to disrupt their ability to exercise C2.

0865. Military Capabilities Supporting IO comprises different activities that are utilized to achieve specific mission or end-state handled or undertaken by military forces, the purpose of which is to destroy a target and win the war or battle. The military capabilities classified under this type are as follows:

a. Operations Security (OPSEC)

b. Information Support Affairs (ISA)

c. Military Deception (MILDEC)

d. Electronic Warfare (EW)

e. Physical Attack

f. Physical Security

g. Counter-Intelligence (CI)

h. Computer Network Operations (CNO)

i. Computer Network Defense (CND)

j. Computer Network Attack (CNA)

k. Computer Network Exploitation (CNE)

l. Public Affairs (PA)

m. Civil Affairs (CA)

n. Information Assurance (IA)

o. Combat Photography (COMPHO)

p. Defense Support to Public Diplomacy (DSPD)

0866. Military capabilities noted above are the key and essential components of all IO planning efforts. Ideally, liaison personnel/planners representing the staff proponent of a particular capability are directly attached to, or affiliated with the Major Services, Unified Commands, Joint Task Force or subordinate command operational staffs responsible for the day-to-day IO mission. IO supports in the planning/integration and execution requirements of the mission by using all the relevant military capabilities. These capabilities are to be used according to the commander's intent and desired outcome. The range of capabilities to be used may vary from one mission to another. A particular capability may serve as either a primary or supporting component in an IO plan. This means that not all capabilities available are necessarily used in a specific IO mission.

0867. Military IO planners should consider a wide range of support from the government& non-government organizations, including all special governmental commission/council, institutional abilities, and activities which can be coordinated to support in the accomplishment of a specific military mission, purpose and its desired effect or end-state. For planning and execution purposes, non-military enablers could include but are not limited to: Philippine National Police (PNP), Department of Justice (DOJ), Department of Social Welfare & Development (DSWD), Department of Health (DOH), Department of Public Works& Highways (DPWH), Department of the Interior & Local Government (DILG), Department of Environment& Natural Resources (DENR), Department of Education (DOE), and Department of Agriculture (DA).

0868. As with other types of operations, intelligence plays a vital role in the planning and conduct of IO. IO is intelligence intensive and requires the availability of detailed and timely intelligence prior to and throughout all phases of the operation. Intelligence enables the conduct of IO by providing relevant and timely information needed to continuously understand and assess a dynamic information environment.

Sustainment Support Operations

"Before a commander can even start thinking of maneuvering or giving battle, of marching this way and that, of penetrating, enveloping, encircling, of annihilating or wearing down, in short of putting into practice the whole rigmarole of strategy, he has, or ought to make sure, of his ability to supply his soldiers with those 3,000 calories a day without which they will very soon cease to be of any use as soldiers; that roads to carry them to the right place at the right time are available, and that movement along these roads will not be impeded by either a shortage or a superabundance of transport."

Martin Van Creveld
Supplying War

0869. Sustainment Support (SS), like all other warfighting functions, is a commander's business. Commanders view operations and SS as interdependent. SS is an enabling operation that generates and sustains Army power for employment in shaping and decisive operations at the time and place the force commander requires. Commanders lay the groundwork to seize the initiative, maintain momentum, and exploit success by combining and balancing mission and SS requirements.

0870. The force commander is responsible for integrating SS into the overall operation. The SS commander, as the force commander's primary SS operator, assists in this. Operators and SS planners view complex military problems from different perspectives. Without integration, the overall operation and SS proceed along separate paths that may not support each other. With integration, the operational and SS perspectives both contribute to the common operational picture (COP) that supports continuous assessment, planning, preparation, and execution.

Purpose of Sustainment Support

0871. SS is a major component of sustaining operations. The art of SS involves projecting a responsive force that generates decisive Army power. Successful application of the art of SS requires proper synchronization between operational and tactical commanders and their SS components. Effective synchronization of operational and tactical requirements enables force commanders to initiate and sustain operations, and extend their operational reach.

0872. SS operations involve the operational positioning and efficient use of all available SS assets and capabilities, from the industrial base to the soldier in the field. They enable force commanders to extend operational reach and to deploy and employ the force simultaneously, without pause. SS operations merge operational art and science into an operations enabler. They minimize the SS footprint by deploying the minimum essential SS elements to the AO and establishing links to and fully exploiting all available sources of support. SS operations include the use of regional staging bases (RSBs), forward-deployed bases and Army pre-positioned stocks.

0873. SS is integrated at all levels of army operations through a seamless distribution system. SS operations enable the commander to generate Army power for employment in conducting shaping and decisive operations within the required time and at a tempo faster than the enemy can react to.

Sustainment Support Characteristics

0874. Force commanders visualize and describe the concept of SS together with their SS commanders. To help them describe the considerations required to conduct (plan, prepare, execute, and assess) successful operations, commanders view SS characteristics from the perspective of the overall operation. SS characteristics are integrated throughout the operational framework, guide prudent planning, and assist

the staff in developing the support plan. SS characteristics seldom exert equal influence, and their importance varies by situation. The commander identifies SS characteristics having priority during an operation; they become the foundation for preparing the concept of SS. The SS characteristics are:

a. **Responsiveness**. Responsiveness is the crucial characteristic of SS. It means providing the right support in the right place at the right time. Responsiveness includes the ability to foresee operational requirements. It involves identifying, accumulating, and maintaining the minimum assets, capabilities, and information necessary to meet support requirements. On the other hand, the force that accumulates enough material and personnel reserves to address every possible contingency usually cedes the initiative to the enemy.

b. **Simplicity**.Simplicity means avoiding complexity in both planning and executing SS operations. Mission orders, drills, rehearsals, and standing operating procedures (SOPs) contribute to simplicity.

c. **Flexibility**. The key to flexibility lies in the expertise for adapting SS structures and procedures to changing situations, missions, and concepts of operations. SS plans and operations must be flexible enough to achieve both responsiveness and economy. Flexibility may include improvisation. Improvisation is the ability to make, invent, or arrange for what is needed from what is at hand. Improvised methods and support sources can maintain SS continuity when the preferred method is undefined or not usable to complete the mission.

d. **Attainability**. Attainability is generating the minimum essential supplies and services necessary to begin operations. Commanders determine minimum acceptable support levels for initiating operations.

e. **Sustainability**. Sustainability is the ability to maintain continuous support during all phases of campaigns and major operations. SS planners determine SS requirements over time and synchronize the delivery of minimum sustainment stocks throughout the operation.

f. **Survivability**.Being able to protect support functions from destruction or degradation equates to survivability. Robust and redundant support contributes to survivability, but may run counter to economy.

g. **Economy**. Resources are always limited. Economy means providing the most efficient support to accomplish the mission. Commanders consider economy in prioritizing and allocating resources. Economy reflects the reality of resource shortfalls, while recognizing the inevitable friction and uncertainty of military operations.

h. **Integration**. Integration consists of synchronizing SS operations with all aspects of Army, joint, interagency, and multinational operations. The concept of operations achieves this through a thorough understanding of the commanders' intent and synchronization of the SS plan. Integration includes coordination with and mutual support among Army, joint, multinational, and

interagency SS organizations. SS characteristics are integrated throughout the operational framework. They guide prudent planning and assist the staff in developing the SS plan.

Sustainment Support Functions

0875. SS consists of many interrelated functions. Planning, managing, and executing support involves synchronizing and integrating them. At all levels of operations, the key SS functions include:

a. **Maintenance**.Keep materiel in a serviceable, operational condition, return it to service, or update and upgrade its capability.

b. **Transportation**. Move and transfer units, personnel, equipment, and supplies to support the concept of operations.

c. **Supply**. Acquire, manage, receive, store, and issue all classes of supply(except Class VIII) required to equip and sustain Army forces. Supply also covers the turn-in, exchange, and/or disposition of items.

d. **Combat Health Support**. Maintain the force by preventing disease and non-battle injury casualties; clearing the battlefield of casualties; providing forward medical treatment; providing en route care during medical evacuation; ensuring adequate Class VIII supplies and medical equipment are available; and providing veterinary, dental, and laboratory services.

e. **Field Services**. Feed, clothe, and provide personal services for soldiers. Field services include clothing exchange, laundry, shower, textile repair, mortuary affairs, and food services.

f. **Explosive Ordnance Disposal**. Neutralize domestic or foreign conventional, nuclear, chemical, and biological munitions and devices that present a threat to military operations and civilian facilities, materiel, and personnel.

g. **Human Resources Support**. Provide all the activities and systems needed for manning the force, personnel support, and personnel services to service members and their families. These activities include personnel accounting; casualty management; essential services; postal operations; and morale, welfare, and recreation.

h. **Financial Management Operations**. Financial Management Operations provide finance and resource management services to commanders. Finance services include pay for vendors, services, accounting, central funding, technical advice, and policy guidance. Resource management services include technical advice to commanders on resource management implications and on the costs of preparing and conducting operations.

i. **Religious Support**. Provide and perform religious support operations for the commander to protect the soldiers', family members', and authorized

civilians' free exercise of religion. This includes the personal delivery of rites, sacraments, ordinances, spiritual care, religious counseling, spiritual fitness training and assessment, religious worship services, and advice to the command on matters of religion, morals, morale, and coordination with nongovernmental organizations (NGOs)and private volunteer organizations as appropriate.

j. **Legal Support**. Perform operational law duties, advice and services in military justice, international law, administrative law, civil law, claims, and legal assistance in support of the command, control, and sustainment of operations.

k. **Band Support**. Provide music to enhance unit cohesion, morale, and to musically support the entire spectrum of military operations. Support information operations, and should be integrated into public affairs, civil affairs, and psychological operations plans. When the musical mission of bands is no longer feasible due to the intensity of conflict, augment security operations for command posts, or augment perimeter security for enemy prisoner of war (EPW) and civilian internee operations.

l. **General Engineering and Contract Support**. General engineering involves constructing, repairing, operating, and maintaining infrastructure and facilities to enhance provision of sustainment and services. Contracting support obtains and provides supplies, services, and construction labor and material. Contracting often provides a responsive option or enhancement to support the force.

Sustainment Support Planning and Preparation

0876. Commanders of unified commands, joint forces, combined arms forces, Army service component commands (ASCCs), support commands, and other operational-level organizations are primarily responsible for SS planning and preparation. SS commanders assist force commanders in developing SS plans based on the vision and intent of higher commanders. Force commanders visualize what needs to be done to support their concept of operations and convey that vision and intent to their SS commanders. SS commanders and staffs develop the concept of SS. The staff then directs subordinate units to take actions to support the concept of operations. They consider availability of sustainment support from the established logistic bases, support from pre-positioned stocks, the maturity of SS resources in regional support bases, host local area support available, and support provided by other organizations. This process is common to all levels of command.

Sustainment Support Planning

0877. Force commanders integrate operational and SS planning through the COP. They require timely SS information to plan effectively. Staffs assist commanders by determining detailed SS requirements during mission analysis. SS planners use planning factors to quantify requirements. Parallel planning among staffs develops SS

plans that provide enough support to generate the requisite combat power for each phase of the operation. The SS plan anticipates SS requirements by phase; SS operators respond to adjustments force commanders make during execution. SS planning lets commanders make operational adjustments while the force continually generates and sustains Army power.

0878. **Sustainment Support Priorities**. Force commanders maximize the use of limited resources by establishing SS priorities and directing priorities of support. SS commanders and staffs then develop a concept of SS that meets the force commander's intent and planning guidance. In developing the concept of SS, they ensure that it is responsive and flexible enough to accommodate changes in the situation. The force commander's decision to exploit an opportunity, reconstitute, prepare for future operations, or continue current operations may alter SS priorities. Shifting operational priorities may require a corresponding shift in SS priorities. During shifts, a temporary reduction in SS capability may occur; however, SS operations never completely cease.

0879. **Sustainment Support Estimates**. The force commander directs the staff and SS commanders to provide estimates that examine support to operational missions and requirements. SS estimates, based on a thorough logistics preparation of the operational space, provide a comprehensive and meaningful picture of SS units, their capabilities, and options for employment. Personnel, combat health support, and SS estimates are used to develop SS plans and annexes. Force commanders require SS personnel to express capabilities and their implications in operationally significant terms. Force commanders state their requirements to SS commanders and staffs in a manner that achieves shared understanding. These requirements may include:

a. The distance and locations to move the force.

b. How positioning SS assets affects the concept of operations.

c. How long particular equipment must remain operational under tactical conditions.

d. The types of material necessary for shaping and decisive operations throughout the AO.

e. The availability and authority for use of Army pre-positioned stocks.

f. Awareness of factors that limit operational reach and sustainability and ways to alleviate the situation.

g. Rapid recovery and redeployment of scarce logistic assets, equipment, and supplies following the completion of operations.

h. Expected medical or disease non-battle injury casualties and replacement rates.

i. Security considerations based on the current threat assessment.

j. Resource constraints on operational infrastructure repair.

0880. Commanders understand that SS is both an art and a science. The SS command and staff challenge is to present force commanders with meaningful information that uses operational measures of support at the appropriate level of detail. Technology advances must always be pursued to enable SS planners to prepare credible SS plans that meet force commander requirements.

0881. **Concept of Sustainment Support**. Force commanders use SS characteristics to describe how SS capabilities enable the force to generate and sustain Army power. SS commanders and staffs use the military decision making process to develop SS courses of action. The concept of SS derives from the course of action that best supports the overall operation. In evaluating courses of action, commanders and staffs ask questions similar to these:

a. Does the force projection flow generate the requisite Army power in accordance with the operational commander's priorities?

b. Are we generating the appropriate level of SS at the right locations for each phase of the operation?

c. Can we simultaneously sustain the entire force throughout the operation?

d. Which characteristics of SS have priority during each phase of the operation? Are they addressed in the SS plan?

e. Are the distribution networks in place to accommodate the sustainment flow?

f. Can we generate the operational reach and sustainability adequate for simultaneous and continuous operations, or do we accept an operational pause?

g. Have we achieved the proper balance between maneuver, operational support (OS), and SS forces, thereby optimizing our operational reach and sustainability?

h. What is the plan for reconstitution of forces, if required?

i. Have we adjusted the SS factors influencing operational reach and sustainability, thereby maximizing the effectiveness of the distribution system and the lines of communication (LOCs)?

j. Have we taken advantage of all available facilities, resources, and sources of support?

k. Have we allocated resources and established SS priorities?

l. Have we assigned responsibilities and made the necessary command and control (C2) arrangements to execute the support plan?

Sustainment Support Preparation

0882. The force commander prepares the operational space by integrating the operational and SS components. SS commanders assist by obtaining, managing, and distributing the resources identified during planning. Negotiating with local contractors for services and materials are part of this effort. SS preparation also includes coordinating with strategic-level SS managers to gain access to pre-positioned stocks or assets received through national-level agreements. Support base locations and LOCs are established and improved to meet operational requirements.

Sustainment Support Execution

0883. The force commander is responsible for integrating SS considerations into the overall operation. The types and quantities of SS required, and the methods used to provide it, vary by type of operation.

Sustainment Support in Offensive Operations

0884. Force commanders consider how the operational framework and SS affect each other during offensive operations. A commander's decision to fight a simultaneous or sequential, linear or nonlinear operation may depend on SS capabilities. SS operations may be affected dramatically by such decisions. For example, in linear offensive operations, commanders may secure SS assets on ground LOCs with maneuver forces. In nonlinear operations, commanders may move SS primarily by air. Regardless of the operational framework, SS commanders and staff support the decisive offensive operation at the time and place of the force commander's choosing.

0885. Effective SS in offensive operations demands SS operators who foresee requirements and prepare to meet them before they occur. Force commanders require a simple concept of SS that is responsive and flexible enough to adjust while executing offensive operations. To sustain momentum and provide freedom of action to exploit success, they integrate SS considerations into plans. To ensure continuity of support, plans include provisions for SS units to follow exploiting forces. Due to the tempo of offensive operations, units may experience high losses from combat operations, combat stress, and fatigue. Recognizing the potential for loss during offensive operations, commanders plan for reconstitution. Planners consider the potential effects these losses have on tactical operations, combat health support operations, strength and casualty reporting, replacement operations, religious support, and soldier morale.

0886. Commanders visualize the effects of rapid tempo on their ability to sustain offensive operations. The tempo and depth of offensive operations wear out equipment and consume great quantities of supplies, particularly bulk fuel and ammunition. The high workloads and evacuation requirements of offensive operations put stress on maintenance, Class IX, and supply operations, and increase Class VII requirements. Greater movement requirements and potentially longer LOCs tax transportation resources. As the Army transitions to a "replace forward, fix rear"

maintenance system, contracted support in forward areas during offensive and defensive operations is less viable than in support to civil governance operations.

Sustainment Support in Defensive Operations

0887. Tactical commanders consider SS capabilities when deciding whether to conduct a mobile or area defense. For example, in an area defense, commanders may position SS assets well forward to respond quickly and be protected by maneuver forces. In a mobile defense, commanders may move SS assets further away from maneuver and OS forces to free up space for re-positioning. Regardless of the type of defense, SS commanders and staffs design a concept of SS that allows a smooth transition to the offense.

0888. SS requirements for defensive operations depend on the type of defense. Forces in a mobile defense consume more fuel than those in an area defense. Typically, bulk fuel consumption may be less than in offensive operations. However, ammunition consumption is higher and will likely have the highest movement priority. Barrier and fortification material is moved forward in preparation for all types of defense. Chemical and biological defense equipment may also be a significant requirement. As with the offense, the force commander's operational design affects the concept of SS. The SS commander synchronizes the concept of SS with the force commander's concept of operations. The SS plan includes branches or sequels that address generating and sustaining combat power after the transition to offensive operations.

Sustainment Support in Support to Civil Governance Operations

0889. SS requirements in support to civil governance operations vary greatly, depending on the mission and circumstances. Force commanders conduct support to civil governance operations in complex, dynamic, and often asymmetric environments. For example, they may be required to establish a presence, separate combatants, restore order, or perform other operations that provide stability. Frequently, force commanders must repair enough infrastructures to maneuver and sustain the force while simultaneously stabilizing the situation. SS commanders and staffs devise concepts of SS that give force commanders flexibility to meet changing situations.

0890. Some support to civil governance operations, such as peace enforcement operations, may involve levels of support comparable to offensive and defensive operations. In other operations, demands may be lower but distances between units may increase. In support to civil governance operations, contracted support and local sourcing is often more appropriate than in other operations. Contracting may be appropriate for such SS activities as food service; morale, welfare, and recreation; billeting; transportation; laundry; and, clothing repair. It is important to integrate support not only with other AFP major services but also with nongovernmental organizations. Class IV and explosive ordnance disposal support may be prominent requirements in support to civil governance operations.

0891. In other support to civil governance operations, SS forces may conduct the decisive operation. Support to civil governance operations involve providing relatively high levels of SS-related support to civilian populations. For example, a

commander given a disaster relief mission such as aiding victims of a typhoon where thousands of homes were destroyed, may need to provide water, food, medical care, and electricity to people in communities spread over hundreds of kilometers. In other support to civil governance operations such humanitarian relief missions in areas stricken by floods or drought, the force must counter disease and starvation. Support to civil governance operations such as these involve providing services to meet the immediate needs of designated groups for a limited time until civil authorities can assume responsibility. Distribution of food, water, supplies, and field services are often the primary activities. Combat health support, which involves such activities as providing basic necessities and establishing or improving basic health and sanitation services, may be prominent as well. The lack of usable road space may place a greater dependency upon air assets. The Army forces best suited to accomplishing these complex missions in difficult conditions are SS organizations.

0892. How force commanders approach providing support to civil authorities affects the concept of SS. SS commanders and staffs devise concepts of SS that meet mission requirements in the priority that force commanders specify. Planners work with joint, and interagency planners, along with local authorities, to ensure support responsibilities, priorities, and standards, as well as rules of engagement, are clearly laid out.

Tactical Sustainment Support

0893. Tactical SS supports battles and engagements. While tactical operations can last for weeks, tactical support is measured in days or hours. Tactical SS sustains force momentum. It focuses resources to support the commander's intent and concept of operations and maximize freedom of action. The tactical SS plan addresses how each SS function supports the operation. Planning identifies SS risks.

Extending Operational Reach and Sustainability

0894. Operational reach and SS operations are related components of the operational art. Commanders practice operational reach and SS operations to extend their battle space in time and space across the range of operations. Effective SS operations are required to extend the depth and duration of full spectrum operations. Commanders study the factors that influence operational reach and sustainability. Only a thorough understanding of these factors allows commanders to understand how SS operations generate and sustain Army power.

0895. Effective SS allows commanders to initiate and sustain operations over time as well as extend the operational reach of the force. Operational reach reflects the operating ranges of combat, OS, and SS assets. Sustainability refers to the force's ability to conduct operations over time. SS commanders enable the force commander to extend operational reach and enhance sustainability through SS operations.

0896. If military operations extend beyond a force commander's operational reach, culmination normally follows. Commanders arrange operations in time and space to

avoid culmination. The essence of the art of SS involves continuously adjusting SS plans and operations within the commander's intent to delay or preclude an operational pause or culmination.

Sustainment Support Factors Influencing Operational Reach and Sustainability

0897. Commanders consider secure LOCs, the distribution system, and C2 as key SS factors that generate and sustain combat power and extend operational reach and sustainability. In allocating resources, commanders take into account the physical factors that limit a force's operational reach and freedom of action. Ignoring these factors risks culmination. To understand their influence on operations is to master the art of SS. SS factors influencing operational reach and sustainability include:

a. **Scope of Support**.The scope of support refers to the types and levels of support provided to the force. It varies with the type of operation, the time to prepare for an operation, the maturity of the AO, and the phase of the operation. As the AO matures, the type of support provided and the locations of support facilities may change.

b. **Distribution Networks**. The Army SS system consists of several interrelated networks: communications and automation, physical, and resource. These networks provide the asset visibility necessary for efficient and effective distribution. The communications and automation network distributes and correlates SS data across the force, while assisting all commanders with management of the information. The physical network consists of the quantity and capability of fixed structures and established facilities. It includes factories, warehouses, airfields, seaports, roads, railroads, inland waterways, pipelines, terminals, bridges, tunnels, and buildings. These facilities can be located in a regional staging base or at a forward deployed base. The resource network consists of the people, materiel, and machines operating within and over the physical network.

c. **Sources of Support**. Support may come from DND, AFP, Army, joint, local sources, and NGO sources.

d. **Availability of Materiel**. Materiel is available to a force through its stocks and resupply. There are several internal constraints on stocks. They include the upload capacity of its soldiers and equipment and the storage capacity for materiel not uploaded. They also include the internal transportation assets needed to move supplies from stockpiles to their point of employment. Effective use of the multiple sources of support can increase the availability of materiel, enhance responsiveness, and improve the flexibility and sustainability of the operation.

e. **Modularity**. Modularity is the ability to provide force elements that are interchangeable, expandable, and tailorable to meet changing missions

andneeds. Modular units combine the assets required to provide a support function or group of related functions. A module can be sent to support a deploying force without adversely affecting the ability of the parent unit to function at a reduced level. Modularity enhances the SS commander's ability to conduct C2 operations as well as the functional SS operations in a dispersed environment.

0898. Force commanders provide for essential SS functions by tailoring and task organizing a force capable of providing the appropriate level of support throughout an operation. This ensures a proper balance of combat, OS, and SS capabilities. Provision of all services in the AO can enhance sustainability and operational reach. These services include personnel, medical, field services, maintenance, transportation, religious, financial management, legal, and explosive ordnance disposal.

0899. LOCs are a key factor of operational reach and SS operations. LOCs are all routes - land, water, and air - that connect military forces with their support base and along which supplies, personnel, equipment, and military forces move. The designation of LOCs and securing their use is the commanders' business. LOCs and the assets on them must be protected. LOCs consist of complex networks, facilities, procedures, arrangements, and units. They link the strategic sustainment base to the operational support base and the operational support base to tactical formations. Multiple LOCs require a substantial increase in forces to secure them.

08100. LOC security and support are essential to SS operations and may affect Army power allocation. The ability to secure LOCs is an important consideration in determining operational objectives. LOCs require particular attention during nonlinear, episodic, or easily interdicted operations. LOC security and support enables effective management of the distribution system that permits on-time delivery of supplies and extends operational reach.

08101. Where the force commander establishes the support base influences the course of a campaign and the support plan. Lodgments are generally established near key seaport or airport facilities. They need to allow easy access to strategic sealift and airlift, offer adequate space for dispersal and storage, facilitate trans-shipment of supplies, and be accessible to multiple LOCs. A key to the success of the SS plan is the capability of the distribution system to receive, store, manage, maintain, issue, and move materiel and personnel to using activities and units at the right time. An effective distribution system allows commanders to generate and sustain the necessary Army power for each phase of the operation.

08102. Commanders adjust and balance SS factors based on their vision and intent. Commanders can enhance sustainability and extend operational reach by adjusting the scope of support provided. Some SS functions can be deferred or performed at reduced levels. Commanders consider such tradeoffs when deciding to adjust the scope of support.

08103. Commanders may adjust the location of certain support activities and facilities to increase responsiveness and force sustainability. If automation and communication networks permit, commanders may require SS units to perform portions of support functions, such as SS management and administration, remotely. Doing this helps

minimize the size of the deployed SS force, reduces demands on LOCs, and increases force agility. The positioning of stocks, units, or other capabilities dedicated for a specific operation is another component of SS operations. These stocks or units may be positioned at home station, an RSB, or another location within the AO.

08104. Commanders must make maximum use of all sources of support. Several factors can increase the availability of materiel, enhance responsiveness, and improve the flexibility and sustainability of operations. These factors include making effective use of local support contracts and assets, support from other civil organizations, and common user support to all services in AO.

08105. Adjusting SS factors can entail risks. When necessary, commanders conduct a risk analysis to determine what SS functions can be deferred, performed at a reduced level, or performed in alternative locations in the short term. Initially deferred functions can be enhanced through follow-on support or call-forward capabilities pre-positioned at an RSB or other locations.

Inter-Agency Coordination and Convergence

08106. The instruments of national power complement and reinforce each other. By understanding the influence of other agencies, commanders can add political, informational, and economic depth to their military efforts. Just as integrating different unit capabilities results in the advantages of combined arms warfare, so is synchronizing military power with other instruments of national power leads to dynamic strategic capabilities. It has to be remembered that the modern military operational area is also populated by civilians who will be affected by the presence of military forces and their effects.

08107. As campaigns and major operations develop, tasks and objectives that directly support military operations but are the responsibility of other agencies are identified. When commanders and planners identify these objectives, they submit them to General Headquarters (GHQ) for consideration and nomination to interagency working groups. Formal and task-specific interagency working groups coordinate policy and assign tasks among the various departments and agencies. Once a department or agency accepts a task, it reports through the interagency working group and eventually to the chain of command.

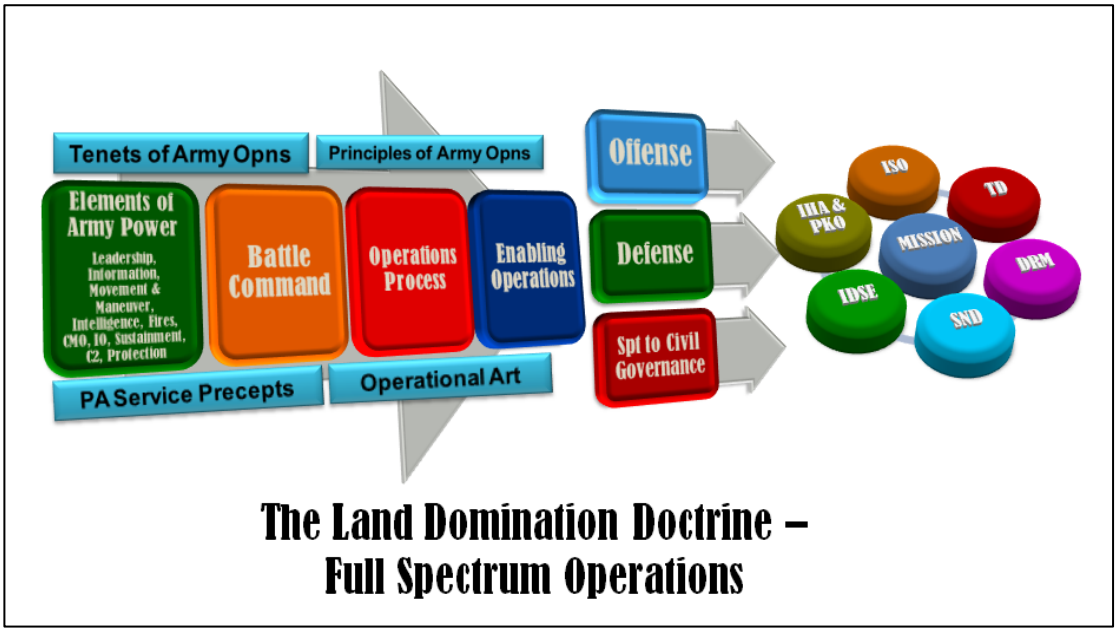

08108. The intricate links among the instruments of national power demand that commanders consider how all capabilities and agencies can contribute to achieving the desired end state. Interagency coordination forges a vital link between military operations and the activities of organizations such as nongovernmental organizations (NGOs); governmental agencies of the Philippines, and partner nations; and regional, international, and UN organizations.

08109. Interagency cooperation poses challenges. Among the most difficult is the lack of mutual familiarity among the various agencies. In joint operations, leaders from the different services generally share a common tradition and understanding of military matters. Interagency operations bring together leaders and staffs that often have no

common experiences. The institutional values and experiences of the separate agencies and departments sometimes have few common points of reference. Some may even conflict. However, education and teamwork can create an understanding and awareness of the missions, strengths, weaknesses, and outlooks of the interagency members. This understanding can mitigate the friction inherent in interagency operations. Almost always, this relationship is in compliance to a memorandum of undertaking, agreement or understanding, or a presidential decree or republic act. In some isolated cases, it is borne out of the necessity and realities on the ground that although there exists no formal agreement between civilian operatives and military units, they need each other not only to survive, but they synergize their efforts to accomplish their respective mandates.

08110. Working with NGOs, on the other hand, often requires soldiers and leaders to be flexible and adaptive. Sometimes these organizations may not care to cooperate with military forces. However, Philippine armed forces cooperate as much as their mission allows. Effective cooperation and coordination with NGOs reinforces the legitimacy of the armed forces involved in a unified action. Often NGOs - if they are well disposed toward the military - can provide useful information and insights concerning the local populace.

08111. NGO capabilities can dramatically reduce the military resources required for civil-military operations. NGOs have local contacts and experiences. They conduct such diverse activities as education, technical projects, relief activities, refugee assistance, public policy, and developmental programs. NGOs are frequently on the scene of a crisis before PA forces. They routinely operate in high-risk areas and usually remain long after military forces have departed. They are a significant factor and must be integrated into planning, preparing, executing, and assessing military operations. Commanders consider the activities of NGOs as well as mutual security and resource or support requirements when conducting unified action.

GLOSSARY

Area of Influence -is a geographical area in which a commander can directly influence operations by maneuver or fire support systems normally under the commander's command or control.

Area of Interest -is that area of concern to the commander, including the area of influence and areas adjacent to it. It extends into enemy territory and to the objectives of current or planned operations.

Army Doctrine - is a common language and a common understanding of how Army forces conduct operations. It is also concise expression of how Army forces contribute to unified action in campaigns, major operations, battles, and engagements. It touches all aspects of the Army. It facilitates communication among soldiers no matter where they serve, contributes to a shared professional culture, and serves as the basis for curricula in the Army Education System.

Army Positive Control - is a technique of regulating forces that involves commanders and leaders actively assessing, deciding, and directing them.

Army Power - is the summation of the potency that any total Army force generates. It consists of eight warfighting functions tied together by leadership and enhanced by information.

Army Procedural Control - is a technique of regulating forces that relies on a combination of orders, regulations, policies, and doctrine (including tactics, techniques, and procedures).

Battle Command- is the art and science of understanding, visualizing, describing, directing, leading, and assessing forces to impose the commander's will on a hostile, thinking, and adaptive enemy.

BranchPlan -is a contingency plan or course of action (an option built into the basic plan or course of action) for changing the mission, disposition, orientation, or direction of movement of the force to aid success of the current operation, based on anticipated events, opportunities, or disruptions caused by enemy actions.

Center of Gravity -is the source of power that provides moral or physical strength, freedom of action, or will to act. The loss of a center of gravity ultimately results in defeat. The center of gravity is a vital analytical tool for designing campaigns and major operations.

Close Area -is where forces are in immediate contact with the enemy and the fighting between the committed forces and readily available tactical reserves of both combatants is occurring, or where commanders envision close combat taking place.

Combined Arms -is the synchronized or simultaneous application of several Army-specific capabilities represented by military occupational specialties to achieve an

effect on the enemy or on a situation that is greater than if each capability was used separately or in sequence.

Command -is the authority that a commander in the armed forces lawfully exercises over subordinates by virtue of rank or assignment. Command includes the authority and responsibility for effectively using available resources and for planning the employment of, organizing, directing, coordinating, and controlling military forces for the accomplishment of assigned missions.

Commander's Intent - is a clear, concise statement of what the force must do and the conditions the force must establish with respect to the enemy, terrain, and civil considerations that represent the desired end state.

Commander's Visualization -is the mental process of developing situational understanding, determining a desired end state, and envisioning the broad sequence of events by which the force will achieve that end state.

Common Operational Picture- is a single display of relevant information within a commander's area of interest tailored to the user's requirements and based on common data and information shared by more than one command. The availability of a common operational picture facilitates mission command as subordinates see the overall operation and their contributions to it as the operation progresses.

Concept of Operations -is a statement that directs the manner in which subordinate units cooperate to accomplish the mission and establishes the sequence of actions the force will use to achieve the end state. It is normally expressed in terms of decisive, shaping, and sustaining operations.

Control -is the regulation of forces and warfighting functions to accomplish the mission in accordance with the commander's intent.

Control Measures - are means of regulating forces or warfighting functions established under a commander's authority used to assign responsibilities, require synchronization between forces, impose restrictions, or establish guidelines to regulate freedom of action. They can be permissive or restrictive. Permissive control measures allow specific actions to occur; restrictive control measures limit the conduct of certain actions. They help commanders direct by establishing responsibilities and limits that prevent subordinate units' actions from impeding one another.

Culminating Point -is that point in time and space at which a force no longer possesses the capability to continue its current form of operations. Culmination represents a decisive shift in relative Army power.

Decisive Operation-is the operation that directly accomplishes the mission. It determines the outcome of a major operation, battle, or engagement. It is the focal point around which commanders design the entire operation.

Decisive Point -is a geographic place, specific key event, critical factor, or function that, when acted upon, allows commanders to gain a marked advantage over an adversary or contribute materially to achieving success.

Deep Area -is an area forward of the close area that commanders use to shape enemy forces before they are encountered or engaged in the close area.

Defeat Mechanism -is the method through which friendly forces accomplish their mission against enemy opposition. A defeat mechanism is described in terms of the physical or psychological effects it produces.

Defense Mission Areas (DMAs) - are defense mission-based sub-programs that are common to all the force/capability-based programs designed to optimize the administration and operationalization of our defense resources as part of the three-tiered Defense Program of the DND-AFP. In the context of the Land Domination Doctrine, these are the operational environments where Army forces will operate in.

Defense System of Management (DSOM) - the overarching system of systems that links capability development strategy to planning, programming, budgeting, execution and performance review.

Defensive Operations -are combat operations conducted to defeat an enemy attack, gain time, economize forces, and develop conditions favorable for offensive or support to civil governance operations.

Depth - is the extension of operations in time, space, and resources. Commanders use depth to obtain space for effective maneuver, time to conduct operations, and resources to achieve and exploit success.

Essential Elements of Friendly Information-are critical aspects of a friendly operation that, if known by the enemy, would subsequently compromise, lead to failure, or limit success of the operation, and therefore should be protected from enemy detection. EEFI

Field Operational Frameworkfor Full Spectrum Operations - is basically the arrangement of friendly forces and resources in time, space, and purpose with respect to each other and the enemy or situation.

Friendly Force Information Requirements - are information the commander and staff need to understand the status of friendly force and supporting capabilities. FFIRs identify the information about the mission, troops and support available, and time available for friendly forces that the commander considers most important.

Full Spectrum Operations– is the Army's operational concept of combining offensive, defensive, and support to civil governance operations simultaneously and normally as an independent force or as part of an interdependent joint force, to seize, retain, and exploit the initiative, accepting prudent risk, in order to create opportunities and achieve decisive results.

General War - is armed conflict between major powers in which the total resources of the belligerents are employed, and the national survival of a major belligerent is in jeopardy. General war usually involves nation-states and coalitions; however, civil wars may reach this level of violence.

Information Environment - is the combination of individuals, organizations or automated systems that collect, process, disseminate or act on information. This also includes the information itself.

Information Operations - is the integrated and synchronized use of selected military and non-military capabilities in order to affect friendly, neutral, and adversarial human and automated decision-making systems while protecting our own.

Information Superiority- is the operational advantage derived from the ability to collect, process, and disseminate an uninterrupted flow of information while exploiting or denying an adversary's ability to do the same.

Information Systems -are the equipment and facilities that collect, process, store, display and disseminate information. These include computers - hardware and software - and communications, as well as policies and procedures for their use.

Initiative -is setting or dictating the terms of action throughout an operation.

Insurgency - is a condition where an organized movement aims to overthrow a constituted government through the use of subversion and armed conflict. It is a condition of politically motivated conflict involving significant intra- or interstate violence but usually short of large-scale operations by opposing forces.

Interagency Coordination - forges a vital link between military operations and the activities of organizations such as nongovernmental organizations (NGOs); governmental agencies of the Philippines, and partner nations; and regional, international, and UN organizations.

Line of Effort -links multiple tasks and missions using the logic of purpose - cause and effect - to focus efforts toward establishing operational and strategic conditions.

Line of Operation -is a line that defines the directional orientation of a force in time and space in relation to the enemy and links the force with its base of operations and objectives.

Main Effort -is the designated subordinate unit whose mission at a given point in time is most critical to overall mission success. It is usually weighted with the preponderance of Army power.

Measure of Effectiveness -is a criterion used to assess changes in system behavior, capability, or operational environment that is tied to measuring the attainment of an end state, achievement of an objective, or creation of an effect.

Measure of Performance- is a criterion used to assess friendly actions that istied to measuring task accomplishment.

Mission Command -is the conduct of military operations through centralized planning and decentralized execution based on mission orders. It is the Army's preferred method of exercising command and control in full spectrum operations.

Offensive Operations - are combat operations conducted to defeat and destroy enemy forces and seize terrain, resources, and population centers.

Operational Approach -is the manner in which a commander contends with a center of gravity.

Operational Art - is the application of creative imagination by commanders and staffs - supported by their skill, knowledge, and experience - to design strategies, campaigns, and major operations and organize and employ military forces. Operational art integrates ends, ways, and means across the levels of war. It is applied only at the operational level.

Operational Design -is the conception and construction of the framework that underpins a campaign or major operation plan and its subsequent execution.

Operational Pause -is a deliberate halt taken to extend operational reach or prevent culmination.

Operational Reach -is the distance and duration across which a unit can successfully employ military capabilities.

Operational Space - includes the environment, factors, and conditions commanders must understand to successfully apply Army power, protect the force, or complete a mission. This includes the air, land, sea, space, and the included enemy and friendly forces, facilities, weather, terrain, the electromagnetic spectrum, and the information environment within the specified geographical area.

Operations Process- consists of the major command and control activities performed during operations: planning, preparing, executing, and continuously assessing the operation.

Phasing -is a planning and execution tool used to divide an operation in duration or activity.

Plan -is a design for a future or anticipated operation. This continuous, evolving frame work of anticipated actions guides subordinates through each phase of the operation. A plan is a frame work from which to adapt rather than a script to follow.

Planning -is the process by which commanders (and the staff, if available) translate the commander's visualization into a specific course of action for preparation and execution, focusing on the expected results.

Planning Guidance – is a broad description of when, where, and how the commander intends to employ Army power to accomplish the mission within the higher commander's intent.

Priority Intelligence Requirements -are intelligence requirements stated as a priority for intelligence support that the commander and staff need to understand the adversary or the operational environment.

Rear Area - is provided primarily for the performance of support functions and where the majority of the echelon's sustaining operations occur. Operations in rear areas assure freedom of action and continuity of operations, sustainment, and C2.

Regiment - is a parent military organization that may include many battalions or other units which rarely operate together but share a common history, traditions, uniforms and other matters. A regiment represents a specific Army capability that has its own set of tactical doctrine.

Sequels -are operations that follow the current operation. They are future operations that anticipate the possible outcomes - success, failure, or stalemate - of the current operation.

Shaping Operation -is an operation at any echelon that creates and preserves conditions for the success of the decisive operation. Shaping operations establish conditions for the decisive operation through effects on the enemy, population (including local leaders), and terrain.

Simultaneity - is doing multiple things at the same time. It requires the ability to conduct operations in depth and to orchestrate them so that their timing multiplies their effectiveness.

Situational Understanding -is the product of applying analysis and judgment to the common operational picture to determine the relationships among the factors of METT-TC. It enhances decision making by identifying opportunities, threats to the force or mission accomplishment, and information gaps.

Stable Peace - is a condition characterized by the absence of militarily significant violence. Activities of actors (such as national government agencies, local government units, corporations, and nongovernmental organizations) are confined to peaceful interaction in politics, economics, and other areas of interest.

Stability Mechanism -is the primary method through which friendly forces affect civilians in order to attain conditions that support establishing a lasting, stable peace.

Strategy -is a prudent idea or set of ideas for employing the instruments of national power in a synchronized and integrated fashion to achieve theater, national, and/or multinational objectives. It is expressed as to what ends are to be achieved, how it will be done (ways), and what means will it require to be accomplished.

Support to Civil Governance Operations - encompass various military missions, tasks, and activities conducted in coordination with other instruments of national power to maintain or re-establish a safe and secure environment; provide essential governmental services, emergency infrastructure reconstruction, and humanitarian relief.

Sustaining Operation -is an operation at any echelon that enables the decisive operation or shaping operations by generating and maintaining Army power. Sustaining operations differ from decisive and shaping operations in that they are focused internally (on friendly forces) rather than externally (on the enemy or environment).

Sustainment Support - is an enabling operation that generates and sustains Army power for employment in shaping and decisive operations at the time and place the force commander requires.

Synchronization -is the arrangement of military actions in time, space, and purpose to produce maximum relative Army power at a decisive place and time.

Tempo -is the relative speed and rhythm of military operations over time with respect to the enemy or situation.

Transitions – are conditions that mark a change of focus between phases or between the ongoing operation and execution of a branch or sequel.

Unstable Peace – is a condition where one or more parties threaten or use violence to achieve their objectives. It may also result when violence levels decrease after violent conflict.

Versatility - is the ability of Army forces to meet the diverse mission requirements of full spectrum operations in various defense mission areas. Competence in a variety of missions and skills allows Army forces to quickly transition from one type of operation to another with minimal changes to the deployed force structure.

ACRONYMS

ADCON	-	Administrative Control
AFP	-	Armed Forces of the Philippines
AO	-	Area of Operations
AOR	-	Areas of Responsibility
ARESCOM	-	Army Reserve Command
ASCC	-	Army Service Component Commands
ASCOM	-	Army Sustainment Command
ASCOPE	-	Areas, Structures, Capabilities, Organizations, People and Events
C2	-	Command and Control
CA	-	Civil Affairs
CAFGU	-	Citizens' Armed Forces Geographical Units
CAMPLAN	-	Campaign Plans
CC	-	Critical Capabilities
CCIR	-	Commander's Critical Information Requirements
CDMO	-	Civil Disturbance Management Operations
CG	-	Center of Gravity
CI	-	Counter-Intelligence
CIO	-	Counterinsurgency Operations
CIVAC	-	Civic Action
CIVREL	-	Civil Relations
CMO	-	Civil Military Operations
CAN	-	Computer Network Attack
CND	-	Computer Network Defense
CNE	-	Computer Network Exploitation
CNO	-	Computer Network Operations
COMPHO	-	Combat Photography
COMREL	-	Community Relations
CONPLAN	-	Contingency Plan
CPVISO	-	Civil Population and Vital Installation Security Operations
CPX	-	Command Post Exercises
CR	-	Critical Requirements
CSAFP	-	Chief of Staff, AFP
CTO	-	Counter Terrorism Operations
CV	-	Critical Vulnerabilities
DAS	-	Defense Acquisition System
DCAPS	-	Defense Capability Assessment and Planning System
DDRO	-	Disarmament, Demobilization and Rehabilitation Operations
DMA	-	Defense Mission Areas
DMO	-	Disaster Mitigation Operations
DND	-	Department of National Defense
DOTMPLF	-	Doctrine, Organization, Training, Materiel and Logistics, Personnel, Leader Development and Facilities
DRfO	-	Disaster Relief Operations
DRhO	-	Disaster Rehabilitation Operations
DRM	-	Disaster Risk Management
DRMS	-	Defense Resource Management System

DRO	-	Disaster Response Operations
DRsO	-	Disaster Rescue Operations
DRvO	-	Disaster Retrieval Operations
DS	-	Direct Support
DSOM	-	Defense System of Management
DSPD	-	Defense Support to Public Diplomacy
DSPS	-	Defense Strategic Planning System
EABOB	-	Emotions, Attitudes, Beliefs, Opinions and Behavior of Target Audiences
ECO	-	Evacuation Center Operations
EEFI	-	Essential Elements of Friendly Information
EOD	-	Explosive, Ordnance and Disposal
EP	-	Enlisted Personnel
EW	-	Electronic Warfare
FFIR	-	Friendly Force Information Requirements
FMS	-	Financial Management System
FSO	-	Full Spectrum Operations
FTX	-	Field Training Exercises
GA	-	Government Arsenal
GES	-	Graphical Estimate of the Situation
GPH	-	Government of the Republic of the Philippines
GS	-	General Support
GSR	-	General Support Reinforcing
IA	-	Information Assurance
IDSE	-	International Defense and Security Engagements
IHA/PKO	-	International Humanitarian Assistance and Peacekeeping Operations
IHL	-	International Humanitarian Law
IM	-	Information Management
IO	-	Information Operations
IPB	-	Intelligence Preparation of the Battlefield
IPOE	-	Intelligence Preparation of the Operational Environment
ISA	-	Information Support Affairs
ISO	-	Internal Security Operations
ISR	-	Intelligence, Surveillance and Reconnaissance
JFC	-	Joint Force Command
LOAC	-	Laws of Armed Conflict
LOC	-	Lines of Communication
MDMP	-	Military Decision-Making Process
MILDEC	-	Military Deception
METL	-	Mission Essential Task List
METT-TC	-	Mission, Enemy, Terrain and Weather, Troops and Support Available, Time Available and Civil Considerations
MOS	-	Military Occupational Specialty
MOSE	-	Military Occupational Specialty Eligibility
NCA	-	National Command Authority
NCO	-	Non-Commissioned Officer
NCSO	-	Non-Critical Support Operations
NDCP	-	National Defense College of the Philippines
NGO	-	Nongovernmental Organizations

NSC	-	National Security Council
OCD	-	Office of Civil Defense
OCT	-	Observers, Controllers and Trainors
OPCOM	-	Operational Command
OPCON	-	Operational Control
OPLAN	-	Operation Plan
OPORD	-	Operations Order
OPSEC	-	Operations Security
OS	-	Operational Support
PA	-	Public Affairs
PAsO	-	Population Assistance Operations
PCDC	-	Provincial Community Defense Center
PcEO	-	Peace Enforcement Operations
PcMO	-	Peace Making Operations
PcO	-	Peace Operations
PEFTOK	-	Philippine Expeditionary Forces to Korea
PhilCAGV	-	Philippine Civic Action Group to South Vietnam
PI	-	Public Information
PIR	-	Priority Intelligence Requirements
PKO	-	Peace Keeping Operations
PME	-	Peacetime Military Engagement
POI	-	Programs of Instructions
POW	-	Prisoners of War
PPBS	-	Planning, Programming and Budgeting System
PVAO	-	Philippine Veterans' Affairs Office
R	-	Reinforcing
RCDG	-	Regional Community Defense Group
ROE	-	Rules of Engagement
RSB	-	Regional Staging Bases
SCDO	-	Support to Community Development Operations
SEPDO	-	Support to Environmental Protection and Development Operations
SLEO	-	Support to Law Enforcement Operations
SME	-	Subject Matter Experts
SND	-	Support to National Development
