NIST Framework

Quick briefing

Use the NIST Cybersecurity Framework (CSF) 2.0 to identify desired cybersecurity outcomes, assess gaps and prioritize work by mission risk.

Know the facts

Six Functions · Govern, Identify, Protect, Detect, Respond and Recover. They cover related outcomes that can be pursued together.

Govern and Identify · Govern establishes direction, roles and oversight. Identify develops an understanding of assets and risks.

Protect, Detect, Respond and Recover · Safeguard resources, find and analyze possible adverse events, manage detected incidents and restore affected capabilities.

Core and Profiles · The Core organizes outcomes by Function, Category and Subcategory. A Current Profile describes outcomes achieved today and a Target Profile describes desired outcomes.

Tiers · Partial, Risk Informed, Repeatable and Adaptive characterize the rigor and integration of risk governance and management practices.

NICTEF · The lesson presents the National ICT Ecosystem Framework as a way to align Philippine ICT efforts around shared national goals, including access, interoperability and trust.

Understand the reasoning

A Profile gap tells you which outcome needs attention. Mission impact and likelihood help decide how soon to act.

A written backup policy shows assigned intent. A successful restore test provides evidence that a service can actually recover.

Philippine Army classroom exercise

A fictional Philippine Army school can fund either a restore exercise for its enrollment system or a monitoring upgrade for a standalone display. Enrollment opens next week, and no one has tested whether its backups restore.

Decision · Which gap should the school address first, and how should it explain the choice?

Worked analysis · Prioritize the restore exercise because an enrollment outage would interrupt a near-term school function and the ability to restore is unverified. Record the gap under Recover, keep the monitoring gap under Detect, and revisit its priority if the display begins supporting a more critical workflow.

How to practice

1 · Scope one training service and identify its users, dependencies and most important failure impacts.

2 · Document the outcomes the service achieves today and the evidence for each in a Current Profile.

3 · Select the outcomes needed for the mission and record them in a Target Profile.

4 · Rank gaps by risk and set an owner, a proposed action and a way to verify each priority improvement.

5 · Review the evidence after the change and refresh the Profiles as needs or conditions change.

Check yourself

Which Function sets cybersecurity roles, risk direction and oversight? · Govern.

What comparison reveals gaps to prioritize? · Compare the outcomes in the Current Profile with those in the Target Profile.
